## GERMAN EXPLOSIVES. PROPELLANTS, AMMUNITION AND RELATED ITEMS

le both WVI and WVII the Germans suffered great shortages of TMT, NG ere and had to resort to substitute explosives (called Eranappengatoffe) which is many cases safe inferior and more expansive than those used by the (Ilies, The same may be said about the propellants. The development of German military explosive and pro-pellents may be subdivided into the following:

A. Paried Before WWI. Black powder was used as a propelfant and he sa explosive up to the eighties when it was replaced for a short period by tends predemind (inally in the direction by implement propellant in avented by Datensholms A hingh-base tubular propellant was undepend in 1879, maker the name of \$2597 (Riberspilers 187) and a double-base tubular propellage (Nitroglyceriapatver) called RP'07 was adopted in 1907, la addition to those the German made a flate proceillant (Blattchonpaleet) and a disk- or cube propellant (Nurfelpulver). As a filler for projectiles the black owder was replaced in 1886 for a short period by sicric sold (PA ) and then in 1902 by THY.

or Period of WWI, Doe to the shortest of MG the German were forced-either to use slagh-hane propallaces or to trobsticute the NG-In double-base propalitants by some other HE, such as TNT or DNT, During the leaver part of WW L ween a shorage of cotton developed due to the Allied blochade, the German resurted to the use of wood pulp in the form of stude paper for afration to MC and nice to the use of compositious not containing new NC or NG Cles Ammenpulver)

As high-explosives for filling projection the Germans used in addition to TNT DNR TNAme and missures of these with Ani nitrate: In the later part of the war, when these aromatic nitrocomounds became scarce, they began union HNDPha, TNX, HNDPh, TNN, HNDPh salfide and their mixtures with Am nicrose. Ph nicrose and K chimese, Commercial blasting explosives; such as Denneis and Westphulit, and other more pensitive explosives were used for projectiles which were subjected to little or no netherit, such as trench morter shalls, greander and bombs. The Germans also sourced to incorporate Al powder is anderwater explaining All of these substituted were sairly powerful and america to the mixtures which they were forced to use during the laser part

C. Period Bolors WWII. Beginning in the middle 1950's the Germous foresaw a war and the gan the development of explosives which goold be used to replace those mend by the nitration of archatic hydrocarbons (derived from con) tur), of which it was patent there would be a shortage. The most important of these applanives were Hexogen (Cyclonics as RDX) and Pentrit (Pentaerythritoitetranitrate or PETN). Both of these explesives were desired from alinhatic compounds of which so shortage was expected during a war. In addition, these exp serves were much more powerful than INT. P.A. or even triry!, but they were too bensitive to be used alone as buretis g charges in shells. This difficulty was overcome, however, thy conting the particles of these explosives with about 10% of Montan was applied in the molten condition. Such explusive mixtures could be safely presslòndes into reojeccibre, such as 20mm to 18 mb shelle co Steaded into boosters or various shell. These mixtures could not be case because the m p a of RDX and PETN are too

high to permit them to be melted with test grandure ateam. When it was desired to load shells by capting, the Germans mixed RDX or PETN with about equal parts of for-melting explosives such as DNB or TNT

In addition to these squaries explosives the Germans. began the development of some rather inferior explonives before WVII. These were called Ernatzeprengetoffe (qv) (Substitute explosives).

An to propellants, about 5 years before WIL the Garmans arrand to develop double-base propellants which contained DEGDN (In lieu of NG) with or without NGs. These were auperior to HG powders because being "cooler" they dunned much lone ecosion of the gue bessels. The development of these propellages was done under the direction of General Uro Gallwitz (See Provellants).

D. Poriod of WWII. At the beginning of the war the Gurmane did not experience a shorts se of aromatic nitrocompounds and were able to use the following explosives for loading saelle: TNT, DNB, PA, weyl, HRDPhA, some slone and others in admixture with other explorives. For under-mane explorives, the German incorporated about 15% of pendered Al is the high explosives, as had already been door by them in WV | (See also under Aluminianed Explosives. main Al.

Of the explosives mentioned above, all except DNB may be considered at good military explosives. DNB in not as good because it is less perserful sad more toxic then THT. it was need, however, to smetch the supply of THE in ametal and manual-evers of explosive miscuses. The communicipals love as at DNB (ca 90") permitted its use with loading mintures cumulaing Am nicrose; Alarre. Such mintures did not exude aven at monical presentants."

As sentland shore; the Germans before WVII. derelegad two of the most powerful explosives, RDX and PETN. Thee these explosions burning southable on as Industrial scale they seared to replace the armeric sitrocomposide as berreing charges for various projectifes, as boosters and se best charges for detenators. This Al powder was incorporated in mixtures of ADX and PETN with other substances the resulting explosives were the most powerful and briance underwater deployives. It was by the use of these that the Germone mask many American and British ships.

The enersions demand for explosives and the shortage of raw meterials created a signation, about 1943, which made it necessary to use aubstitues inferior to TNT, thus lowering the efficiency of their amounttion. These mixtures are listed, and some of them described, under Ernstaurenestoffe

The Germans used single-base propellages in small arms and is some smaller guns, while double-best propelleurs is which part or all the NG was replaced by DEGDN for accestimes TEGDN), with or without NGO, were used in 37 mm of larger caliber cannont Arpropellant of rabular evanulation was used for guns, while either flake or disk type was used in howsters See Propellants ! .

Following are some figures for the monthly production. in metric tons of the principal high explosives for the years 1943 and 1944:

Explosiven	As of June 1943 (Produced)	As of June 1944 (Scheduled)
INT	16,600	21,000
PA .	280	400
DNB	1,380	.5,000
Tetryl	16	30
HNDPLA	650	950 -
RDE	2,470	7,000
PETN	820	1,409

which is general, constrained where this could be done with was tomong may difficulty to the tender. However, a period was tomong may difficulty to the tender. However, a period was meet as the sud of each dictionary item to indicate the conclusion of the item. versus not of the item. Some item many innertions were made by Dr Federoff and not edited. For femiry processing, past Raglish, or inregular arrangements, be assument the spacehility and beyon that the some of the test is close everywhere.

It is hoped that the Genisral and Analytical sections of this project, "A Dictionary of Espisielves, Association and Wampens", will be liestyped and present a better appearance that was possible in dark

# NOTE

The General and Analytical Sections referred to in the body of this Section have not yet been published. It is expected that preparation of the General and Analytical Sections will be started early in 1988 with a publication target date sometime in 1960. Data under each letter of the alphabet will constitute a separate report.

The General Section will cover American and British explosives. erdance terms and a short resume of American and British assument tion and weapons.

The Foreign Section will include explosives, amountains and wear. one of countries other than US and British, i.e. German (this section). French, Italian, Japanese, Belgian, Czech, Spanish, Swedish, Swim, and Russian. Only the Russian Section has been published to date as Pleating Areenal Technical Report No. 2145, February 1966. The English Section is classified Confidential.

## LIST OF GERMAN EXPLOSIVES AMMUNITION AND RELATED ITEMS

"121" (Piring Composition), See Firing Composition 121, "A" (Rehotes), "A"/ Ruckets ) . Beginning about 1933, the Germins started to experiment with military rockets. The first model was the A-l which weighed about 330 lbs and was 57% long and 1 ft in diameter; it was unsuccessful. The pent rocios, the A-2, which appeared in 1934, was an improved A-I and when fired it reached as altitude of 6000 feet. In 1938, at Pecasumude, the A-3 was developed. This was the predeceasor of the A-4, developed in Ducambes 1942 and now commonly known as the V-2. The A-3 rocket weighed 1,650 the sid was 25 it long and 2% fe in diameter. The A-4 sector to new was at a sung sen 479 rt is enumerer. Law Art sector to bejerfy described under V-2- The next A recites that were depeloped at Poissemmedes the A-5, A-6, A-7, A-8, A-9 and A-10, were purely experimental. Among these, the A-9 and A-10 were insended for bombardment of the U.S.A. The A-2 was intended to be catried aloft by the A-1 during the first phase of the trass-Atlantic trip.

Active Shooth (Aktive Musci-purrose)-A type of shooth con-mining MG or NGc (nirroglycol) together with inert ingredients was used by the Germans for some permissible explosives, such as Vetter-Wassgit, etc. One of the earlier active sheaths consisted of NG 15, such salt 35 and Na bicarbona to 30% but this was later changed to NG (with or without nitroglycol) 17, rock salt 33 and his bicarbonage 55%. The composition of some other active sheaths were:

Sheath			N=CI	Na bicarbonase	Kieselgule			
M <sub>1</sub>			35.0 53.0					
M.	12.0		68.0	20.0				
MA	11.0	1.0	87.0		1.0			
M <sub>s</sub>	10.0		88.0		2.0			

The sheathing operation was carried out out the Sythest plane of WASA-G, on a modified Rispansan curridging machine, permitting caterings weighing 70 genus to be shouthed with "35 genus of active sheuthing meterial. Hose: According to Scottbacher (Ref 3) a shouth (Mantelparrose) 25 mm in dispareer and 3.5 mm thick, consisting of No bicarbonnes 82 4 85 with NG 18 - 13%, reduces the sempermuse of the groun of detonation from 2000 for in sentential explosive) to 400 C.

News: According to T.Urbeheki, Pracenys! Chemiczney 4, 487, (1948), the active layer (sheeth) was nade in the form of a nabe slightly larger than the carridge of the regular charge. The carridge was then inserted into the tube. When the catridge was exploded, the combastible protective when the carriage was explored, the comounter protective layer (sheath) was dispersed and vaporised, the forming a "cloud of salt" which prevented the spation of firedamp or coal dust which night be exceed by the cherge slows.

Aorial Burst Funos are devices designed to function a bomb while will in flight. Following Garmon funos are briefly described in TM 9-1985-2 (1953), pp 132, 168, 171

1) (41) Mechanical Clockweck Fuse was used in SD 2A Butterfly bemb (pp 132-5) 2) (29) Mechanical Asrial Burst Fuse, used in the LC 10f 2) (29) Mechanical Assial Burst Fano, used in the Lu Juvanial manife unit purschuse Hart, consissed of a bakalite heusing containing a closing cap, withdrawal, legacity spring, strikes puller gasdes, sumker peliger, switch containing a color spring, two ball decreases, and a juriler return spring. The withdrawal log and die system access upon, thing spenas, two data occasion, and solices recurs opining. The vithdrawal lag and the viscing cap were retained by a cond which was attached to the flare desconded the value, of the condition of the condit aufficiently to withdraw the ascriber desart pia. The ball densets were then, free to nove immed, and the surface peller was becede by the firing, spring to carry thinks, the series peller compressed the artiker return spring. The flash from the cap ignited the delay element (and), direc the delay, the decounter included the units

and, after the delay, the decounter initiated the main

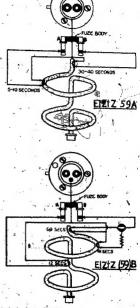

3) Pyrotechnic Aerial Burst Fuzes (49)All and (49)Bil mere med in some rocker bombs, each as PC 500RS and PC 1000RS (p 169)

500Bs and PC. (1000BS (p. 169)
4) (39) Mechanical Aeriaj Butes Fuze was used in parachase flares and photoflash bombe (pp. 171-27)
170 (pp. 171-171)
170 (pp fired as soon as the bomb or flare left the aircraft, initiating pyrosechnic delay trains which provided the aetial burst functioning. The shorter delay was fired from the A plunger and the longer delay from the B planger. If both plungers were charged, the short delay mactioned and if only B was charged, the longer delay from functioned. The inner construction of both fures was the same, but the (39)A was twice as long as the 59A (p 172)

398 (p. 172)

5) (59) Electric Aerial Burnt Fuze (El Zv.Z.) used in SC 350 bomb and in some parachute flaren, differed from the previous fuze by having three igniums instead of the conventional two. The igniter under the A plunger. was in such a position, as to give a 12-second delay. wan in such a position, as to give a le-second delay. The other, two igniters were under the 8 plunger and gave 41 and 58 second, delays respectively. If the subset delay wan, required, both plungers were charged, if a longer delay was necessary, only the B plunger was charged (pp 172-3)

71 69Cll. 69D and 69E Electrical Actual Baret Funca (Pyrotechnic Delay, used in various bombs and con-tainers, were cylindrical in shape and made of significanthe release from the place, the igniter bridge fired igniting the loose black powder. This is turn ignited the preparchaic delease interests. the pyrotechnic delay mixture (no composition wan given). On expitation of busing of the delay, the flash cosposition and the black powder pellet were

ignised, esc (pp 174-5) Ignatese, etc. (pp 174-5)

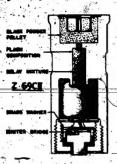

8) 79, (79) and (79)A Electrical Aerial Burnt Fuxes

ley Steels, especially high compensure alloys, such Biblier alloy, Counsiler, Reneate, Stevenst S, Thompsele d Tennez are described in CIOS Roys, File No. 25-23 (1946)

on (Alusium) is described in the general section, erann electrolytic method of manufacture of Al guite in described in CIOS Royc File No 23-4 (1946)

Aluminium Employees (Aluminiumhaltice Spreagatoffe). The use of Al explosives was begun about 1900 (in Augtria) and such explosives were known as Ammonals. One such explonive was tested in France in 1902 by the Commission des Substances Explosivés. According to Lheure it contained; Al 25. Am nitrate 71, chercoal 4%. Another aluminized explonive, called Führer, contained: At 14, Am hitrare 83 and chercost 3%.

The role of Al in explosives was not very clear until secretly when it was explained by A.Stettbacher of Switzerland (Ref 1) and H. Shiraolic of France (Ref 2). After it was found thus Al in particularly effective when used in underwater explosives, the Germans replaced their underwater explosive of WW I: TMT 60.HNDPhA(bexanitrodiphenylamine 40 by the following mixture: TNT 55.7, HNDPhA 27.9 and Al grit (40-70 mesh) 16.47. The same idea was followed in Sweden, where Al was used in their Bonix and Novit explosives. Great Britain and the USA sinc included Al in underwater explosives; such as Torney and Tritonal (British UVE). The Italians and Japanese also used Al explosives. According to Stettbacher, another German underwater explosive contained: TNT 61.8, HNDPh A 230.

Among German sliminized explosives developed below or during WI II may be cited: S-6, S-6 modif, S-19, S-22, S-26. E-4. EMA and S-16. Their compositions are given under Ersauagrengatatie (See also Anagon, Berclavie B, and Nitrobaconit).

(For more information see Aluminized Explosives in the erectal section).

Annel (Fillpulver, abbreviated Fp) (Amazol). The composition of most anatols was TNT and ammonium aitrate, but the designation was the reverse of the American amatule. For instance, German 40-60 Amatol of Fp. 40-60, corresponded se the American 60/40 Amerol (Am aitrate 60, TNT 40), (See also Filler No 13, - No 14a and - No 88).

There were also German ametals which commined no That but some other explosive or explosives. These amazole Old 39, 40 and 41) are described below.

Amount 39- A mixture developed by Romer (Ref 2) as a burnting charge for the V-I tockets, it contained DNB 50. Am nitrate 35, 3DX 15, and was claimed to be an powerful as Fp 60/40 (TNT 60, Am netzare 40). Due to the testicity of DNB, londing of the projectiles was ventillation. As it was difficult to cast-load Amazol 39 uniformly (without formation of cavities) in large caliber projectiles, G. Romer (Ref 3) used the so-called "Biscuit" loading method, in this method, a projectile was filled alternately with pieces (pellets) of so-called bincuit mixture A" (Am nitrate 30, rechnical Ca nitrate 25. PETN 10 and RDX 15%) and molten Amatol 39 at a semerature of about 80°. The resulting mixture formed no cavities on cooling. he dennity at room temperature was 1.58, velocity of detonation 5600 m/sec, Travet lead; block expansion test 350cc for a 10 g sample one a creater cost value (Staucherste) (construction of a lead block) 17.5 mm.

Notes: a) According to Ref 3. Amorol 39 was developed in 1939 at the Krijmmel Fabrik of Dynamit A-G and was used for filling projectiles.

b) One of the Amatols 49 was used in underwater explosive charges.

Amorel 40. This explosive was sometimes used during WW It for filling the war head of V-I Rockets, it contained DNAms 50, Am nitrate 35 and RDX 15%, it could be cast-loaded like TNT (Ref 3).

(Another composition, also known as Amerel 40, is given under Franzuprengaroffe ).

Amered 41. An explosive similar in composition to ammonites: Am nitrate 52, Ca nitrate (tech) 6. PH-Salz 30. RDX 10, months wax 2%; density of fragments 40 m (TNT 40 m): used in bombs (Ref 3),

Note: According to Ref 1, Kast, as early as 1985, proposedthe mixture of Am nitrate 40 and TNT 60% for cast-loading German projectiles. The same mixture was used later by the British under the name of 40/60 Amaiol, According to Urbanski (Ref 3) an Amarol of WW II contained TNP 50. RDX 5-10 and Am nitrate 45-40% by the DNB Dinitrobensens; Abbreviations: DNAms Dinitroanisofs: DNB Dinitroanisofs (PETN Pentserythrio) tetranitrate; RDX Cyclonite; TNT

Ammongolver (Ammonpowder) A propellese first musufactured in 1890 in Austria by incorporating Am nitrage 35 with charcoal 15% and compressing the mixture into large pellers to a density of about 1.4. It was used during WE by the Abstrians and Germans as a substitute for NC propellant and ballintite and was claimed to be very effective and practically mokeless, flashless, and erosionless. On the other hard, was found to be difficult to ignite, gave rather irregular ballistics and had a readency to dinintegrate on atorage due to allotropic change in the fin nitrate at 32° (90°F). In order to minimize irregular ballistics, only 1/3 to 1/2 of the to minimize irregular parisasce, only all to all im-propelless charge consisted of Amonopulver, the reas Being NC propellant. In order to protect the Am silicate from an mospheric moisture the pellets were sometimes suclosed

in a box made of thin sheets of double-base prorellant (Ref i. Money According to Davis (Ref 3), Ammortalives contained a small amount of an aromatic nitror; supposed in addition to the above listed components.

The Ammonpulver described by Husbat (Ref 2) contain

Angenithm with (Angenis Capa). Due to the anomage of beans during WVI, the Germans used zinc and zincated iron cape. They were filled with TNT as the beer charge and compressed silver fulminate as the primary charge. The ensemble was called Assonithapsel. [ P. Naoum, Schieseund Sprengatoffe, Steinkepf, Dreeden (1927), p 185 ]. Anthoresett Wind Gun. See Wind Gun.

Antibonb-up Fuzo (Astirupture Fuzo), such as AZ (2004; was a mechanical impact base with a safety aming period of 10 seconds provided by the clockwork gest train. There were two striker systems incorporated: se isercia strike. wery two striker "systems incorporated: as isertial spitker-system to operate on impact and an antimptowt...giffer to 'haccion in case there was any distortion of bonk...or, flass-pocket on impact. The two profiles "systems, were located at opposite ends of the fast separated by a 'flash channel shout 260 ms long. This 'lates, as well as the AZ. (24), are described in TM 9-1985-2 (1953), pp. 135-9. They were used in banh SZ (2500 kg.

(See illustration on next page)

Antidiaturbance Fuza (Electrical) was a device designed to function if disturbed after the humb, dropped from a plane had come to rest. One type, the 50, consisted of a postulation towar constitutes as detected circuit (row con-densions, tow registers, a super-sensitive hall-rembles which and bridge wire of primer) and row charging plungers. The base of the cylindrical case was threaded to nevertous from the plane was conducted through the charging plungers into the charging condenses. During the flight the charge slowly leaked through a high control of the charging plungers into the charging condenses. During the flight the charge slowly leaked through a high control of the con-tinuated, the trembler which caused the circuit to be closed. This ignited the pointer, instanted the booster and demonated as fill charge of the book. This slay took places this case the current from the condense preparated the writch. TIM \$198-104-104. Apri-Ricacher Plates. Circular shaped metallic devices attached to the source of some aircraft hombs intended to prevent ricochet when striking at an angle of obliquity against very resistant targets (such a grace), or to prevent extensive penetration into less resistant targets (such as prace), or to prevent extensive penetration into less resistant targets (such as concrete or wood when authing them at an angle close to norwall. (See linearization on next page and also under Kopfring) [ TM 9-196-2 (1933), p 4 ].

SC 50

Antiwithdrawal Fuxes (Nechanical) were designed as protective devices to prevent withdrawal of regular time fuzes from bosobs. Three types of such fuses are described in TM 9-1985-2 (1953), pp 177 & 179-181: ZwaZ 40, Types 1, II and III. The type 2 fuze consisted of a cylindrical the gains of the time fuze which it brockered, and a second which was threaded into the base of a ZusZ 40. An attempt to withdraw the fuze would cause the steel ball (below the detent spring) to be displaced, thus allowing the artiker to hit the deconator. The resulting flash was transmitted drough a small channel to the booseer and the bomb was exploded. To prevent the withdrawal of the Zusz 40 when the time fuze was removed, spring-loaded thile adject were placed in the upper part of the device. (See illustration on next page).

"Annie Annie" or Loopeld 280 mm Railroad Gun, Model 5 (See under Venpous) Armored Care are described in the following referencest:

Arts (Azite), A mining explosive reported to be manufed by VEB Sprengstoffwerke, Gnaschwitz, Ita approximate compovition is NG, pyroxylin, sawdust, TNT and inorganic sales.

Arrewheed (Needle Point) Projectile, such as 5 cm PagiPate 40 for 5 cm Pak, was a 50 mm AP proj which consisted of the following components: a pointed tungsten carbide core cemented to a steel body which had forward and rearward flanges, a plastic strowhead shaped head covered with a sheet steel ballistic cap and a tracer assembly. The forward flange acted as the rotating band, while the rear flange acted as the bourster.

"The Past 40 was fired from a normal gun. On striking the armor, the ballistic cap, the head and the body with ocities and high armor penetration at short faires and the penetration hale was small in comparison with caliber (See also Tapered-Bore Gun Projectite). There were also 37 mm (3.7) cm PagrPatr 40), 47 mm (4.7 cm PagrPatr 40) and 75 mm (7.5 cm PagrPatr 41)

ARROWHEAD PHOJECTILE

Arece Projectile 'spfeilutabiles Genchous' in a sleader, very long, fin-subilized subcaliber projectile fired from a smooth-bore gun at aupermenic velocity. Its development which is described in Ref I may be considered as one of the outstanding German achievements of WW II Some of these projectiles were used in the attack on the Maginot Line and were enccessful in penetrating concrete. Their subsequent use was confined to the Rubsing front.

Note: The two principal German HE bombs were SC and SE. The SC, or general purpose bombs, had loading factors of 30-578, and became of their destructive quality were used primarily for general demoiston. These bombs were shally of three piace areal construction, with the some being welded to a tubular body and the sheet steel or alloy tail being structed to the bomb hody by accewe or rivets. The SC bombs were not streamlined. The SD bombs, being either AP or SAP, had a joiding factor of about 35% and, because of their passersaire qualities, that used primarily against ahips of fortifications. The bombs were accamilised said had thicker wills than the Sc. They were usually drawn or forged in one piece. A tail extension with a dummy wraws or torgod in one pace. A rail extension with a dummy fase head was generalized attached to give the bomb a most streamlined appearance. Other bombs SA; SB, SBe, etc. may be characterized as follows: The SA and SB bombs were thin walled with

loading factors as high as 80%. They were designed to give maximum blast effect. The 58s bombs had thick ton-trere walls resinfected with sarel and their loading factor was about 20%. They were illed with 4 low power apploating and were usued for the same purpose as 50 m. The 70 bonds and were used for the same purpose, as SD a: The PC books were AP and used remainly against phis and fortifications. They were slightly streamlised with a heavy note chardened, can breat) and heavy wait in factor men's livin the chickment decreasing toward the base of the homb. Thus, the contract the same of the course of

Ð

bombs constructed from concrete. The BLZ, KC and NSC bombs resembled in appearance the SC bomb by bad different fillings. The SP, tragmentation, A/P bomb is not described in TM 9-1985-2 (1953)

The following bombs are described in the U.S. Dept of the Army Technical Manual, TS -9-1985-2, Gorman Explosive Ordnasce, Washington, D C (1953) p 1 to 124.

1) SC 50 kg Bi was filled with 24.4 kg of cast ThT. amatol or trialen (p 6)

Note:TM 9-1985-2 (1953) does not give the German equivalent of Bi but himply says that the bomb had a one-piece cast steel body machined, all the firrings were welded in place. 2) SC 10 kg Grade 1 / In, L, and Stabo were filled with 21 to 25 kg of cast TNT, powdered smatch or cast

runden (n.6) 3) SC 50 kg Grade JI - JB, JC/- J and J/2 were filled with 21 to 25 kg of TNT, amerol or males (p 7) 4) SC 250 kg - Types 1, 2, and 3, J. L. L2, B and K more filled with 287 lbs of smatol, TNT, TNT and wax,

be-wood meal and Al powder and naphthaleue and Au aigrate (p. 8)

5) SC 500 kg Grade III (E. L2 and 1) were filled with 220 ha of amerol. TNT or trialen, Bombe recovered with relates filling contained also up to 500 cylindrical purposer trapped pellem composed of RDX/Al/war(p %). " 6) SC 1000 kg "Hermann" (C. L. and L2) were filled with

about 500 kg of assetol, TNT/Al/wood metal or triales 7) SC 1200 kg was filled with 652 kg of trialen.

8) SC 1800 kg "Same" was filled with amotol, TNT or triales (p 11)

9) SC 2000 kg mps (filed with 975 kg amotol (p 12). 10) SC 2500 ha MAX was falled with trialen by a mixture of anatol with BOX and Al powder (p 13)

11) SB 400 kg Kugel K - "Kurt" Apperatus was filled wish 300 be high explosive. It was a "skip" bomb designed to operate has a skipping atoos over a smooth water surface for use against ships -- power plants, lock eates,

etc. (pp 14:16)
12) SB 1000 kg was filled with 735 kg RDX/Al/wax bencuirs in a Trisles 106 magis (p 17)

13) SB 1000 kg Pamchuse was filled with biscuits consisting of Am nitrace 51, Ca pitrace 31 and RDX 16% in matrix of DNB 48, RDX 15, and Am number 17% (pt-2) 14) SB 2500 kg was filled with 2400 kg amatol or Triales 105 'P18)

15) SD 50 (U50, D500 and D50L) were filled with 16.4 ks TNT (p 19)

16) SD 250 kg (D250, D250]B, D250L med D2500L) were felled with 79 kg TNT to 201

17) SD 500 kg, SD 500 A and SD 500 E were filled with about 200 kg ametol or TNT/wax (p 22)

18) SD 1700 kg was filled with 730 kg of TNT or amatel

19) PC 500 kg, D 500 E, and D 500 Tywers filled with about 75 kg of TNT, TNT/wax or ametal (p 24) 20) PC 1000 kg, ESAU was filled with 160 kg TNT/was

(p. 24) 21) PC 1400 kg, FRITZ was filled wen 500 kg of TNT/

wax or triales (p 25) 22) PC 1600 kg was falled with 130 kg RDX/AL/TNT matter (p 26)

23) PC \$00 kg RS was 'tilled with 14 kg TNT (p 23/ 24) PC 1000 kg RS was filled with 54 kg TNT (p 29)

25) PC 1800 kg RS was filled with 360 kg of TNT and trialen. One specimen had I blocks of NGs in the none and 10 blocks of RDX/Ai/wax is two cardboard cylinders

in the body (n. 30)

26) PD 500 kg was filled with 32 kg RDX/Al/wax to the body, associated with a nose filling block of NGu (p 31) -

27) 0.5 kg A/P Parachute bomb contained I oz of an explosive (p 32)

28) 1 kg SD 1 Morent continued cast TNT (p 33)

19) I he SDL FRZ contained amatol or granular TNT The FRZ was a French bomb used by the Germans (p 31) 301 7 kg "Butterfly" SD 2A and SD 2B was filled with 3.5 oz of cant TNT surrounded by a layer of hiruminous composition (p.34)

1)) SB 3 kg contained 4 lbs of an explosive (p. 35). 12) SD 4 kg HL (hollow charge) A/P and Vehicle contained 12 as of cast TNT or 46/54 - TNT/RDX (p 36) 33) 5D 10A Types I, II and SD 10 FRZ contained TNT or amarol (n 48)

343 SD IOC contained about 0.75 kg of an explosive in 193 35) 12 kg SC 10 Concrete contained 0.9 kg TNT (p 40) 36) SD 13- Conversed Projectile contained hollow (shaped) charge explosive (p.40)

(37) 5Be 50 kg Concrete in earlier specimens contained TNT. and in all later bombs a nephthelene exploure mixture of low brisance (p. 42)

18) SBe 230 kg Concrete contained TNT pellets and a misture of Am nitrate with small amounts of wood meal and Al powder (p. 43)

39) SA 4000 kg contained biscuits of RDX/AI/wax in a matrix of 50/50 Amazol (1943).

39a) BT (Bomben Tospedo), 206 kg, 400 kg, 700 kg and 1400 kg (p 44)

40) 2 kg Assessats Towed Paravane was filled with a HE in 461

41). 3 kg, 1.3 kg, 2 kg and 2.2 kg Incendiary contained thermite as the incendiary and a RE as the burnter charge (pp. 46-30)

42) 30 kg lacendiary (Sprengbrond C 50) contained thermite as the incendiary and TNT as the burstes charge

43) 250 kg Incentiary (FLAM) contained an oil incendincy mixture and TNT as the burnter charge (p. 52). 44) 500 kg incushings (FLAM) contained a mixture of 70/30 - percolcum/benzana se the incendiary and TNT so the burnter charge (p. 54)

45) 50 hg incrediary (Brand C 50 A) contained about 30 lbs of a mixture consigting of benzine 86, phosphorus 4 and name rubbes 10% (p 54)

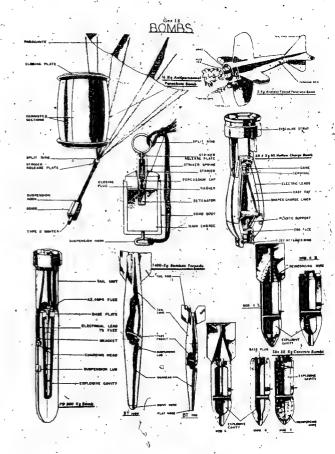

40) '50 kg Incendiary (Brand C 50 B) contained about 77 lbs of white phosphorus (p 55) 471 250 kg lacendary (Brand C 250 A) Types I and II.

contained a mixture of petroleum 87.7, polystyrent 11.7 and phosphorus 0.5% (6.56) 48) 50.kg Smoke (NC 50) contained a light grey smoke

producing substance smelling atroughy of camphor (p. 58 49) 50-kg Smoke Market (NC 50 WC D/SEE) contained as unidentified amoke producing composition (p 58) 50) 250 kg Smoke (NC 250 S) contained a maxture of sulfue trioxide 60 and chlorosulfonic acid 40% (p. 593 31) Practice Bombs: SD 1, SD 2, ZC 10 kg Concrete, ZC 50 kg Concrete, PC 1000 RS EX. and AC 250 kg Concrete are described on pp 59-65 of TM 9-1985-2

52) Parachure Flares: LC 16 Single Camille 1 it 56 Single Candle, LC 50 F Augl C Four Candles, LC 50 Ausf E, LC 50 F Ausf G, Mark C 50 FA, Mark 50 Kark Targer Indicating, Mark S. Types 1 & 2 and some others are described on pp 65-79

33) Smoke Flares Orange were used as ward drift

indicators (pp. 79-80) 54) Smoke Signal Flures and Distress+Signal Torch

55) Photographic Flash Bomb, BLC 50 (p. 81) 56) Photofiash Bomb, BLC 50 (p. 81)

57) Tareet Indicator, Red (p 84)

58) Marker Bomb (Sea) (p.85)

59) Sen Marker,"LUX EZ"50 SC (p 86)

60) Single Unit Ground Marker, Mark 3, Green (p 87)

61) Parachuse Recognition Smoke Generator (p. 89)

62) "LUX N" (Flame Float) (n 92)

63) "LUX S. (Flame Float) (p 93)

ee pp 93-120 of TM 9-1985-2"

, 65) Meanage Tubes (Sea and Land) (pp \$20 - 1). Mt. Hehlladung (hellow charge), MK Mark, MFB Monoritro-behaune, MGe Nirroguanidine, #5 Rocker-annised, PG. Asmer-plescing, PD Asmer-piegeing, thick-walled, \$4 High capacity (HC), She Concrete fragmentation, SC General numone (GP), SD Antipersonnel, ZC Cement cylindrical.

(See slao Abbreviations at the end of the German section); References: 1) Technical Manual TM-E-9-1983 (1942), "Engay Bombe.

nng runnu 27 Dautsche Abwurfmanizione, Berlin (1943) 3) Tachnical Manual TM 9-1985-2 (1953).

"Rombe BV-226" of Blohm and Voss was described on 99-100 of the book A.Ducrocq, Les Armes-Secrittes Allemenden, Berger-Levrault, Paris (1947).

Bonk High Emplories Troin Concof the German RE trains used duling Will in bombs consisted of the following parts: A. Electric primer. A ailver bridge wire with a bead, which consisted of a passe made of lead styphnate, collodion corros and amyl accetate, dried after applying, in order to increase the flame produced on ignition of the head by the red hot bridge, the bend was surrounded with 80/20 KClO /sharedal?

B.Delay. Composition for the delay element varied, de-

pending on the desired delay time. a) Delays up to, I second commined black powder. b) Delay 3 to 14 seconds consisted of KClO4 10, PhCrO. 50 and natimony 40%. As this mixture was difficult to ignite from the bend of the igniter, the following ignition mireure incilitated this operation; red lead 25. NC 5, carborundum 20%. In order to intensify the flame of the delay, the following booster composition was used KClO4/56. Pb ferrocyanide 38, resin 6%. c) Delays up et 40 seconds contained BaCrO, 78.0, Ze 21.0, K Cro 6.4, NC 0.5, was 0.1% and were used in conjunction with the similation mixture and hooster, as described under (b).
C. Reley. Two kinds were used; black powder, or the follow-

ing mixture: ECiO, 25-30, Pb (SCN), 40-50, NC 20, sulfur D. Detension contained land axide, sensitized with lead

styphnate.

E. Sub-honorer consisted of a layer of PETN over PETNwas missure contained in a cup, called the "gaine. The gaine was autrounded by a pressed PA ring with the estimander of the fuze pocket filled with pressed P.A.

pallets to act as a booster.

F. Auxiliary beester consisted of pressed TNT pellers Note: Practically all German bombs contained as suxifiary booster; which was intended to assure the detonation even when -using low grade explosives for charging bombs. The following were the principal explosives used in

German bomba: TNT, TNT-wax, Amatol, Ammonal, Cycletol, Hexamics and Torpex.

[ Allied and Enemy Explosives, Aberdeen Proving Ground, Md. (1946), pp 167-9 ).

Beester, Beester Cherge, Geine (Zilndladung, Briladung, Schlagladung, Anfeuerungsuarz). The German booster was a cylindrical alumnum or brass constance (garas) filled with a HE (such as PA, 'PETN/wax or RDX/waz) and containing, inside the forward end, a deconator lilled with coataining, inside the forward end, a decoance (filled with PETN or RNZ sad a priming layer of M F for boosters filled with PA or with LA/LS is yet in other insent. The purpose of this most of the filled priming layer of the proposed of the proposed of the fure decoance, to smallify the filler of the shock wave, and, in turn, its detonate the man booster charge. The properted P A filling was in beast contineers. The PETN/was and RDX/was fillings were in compensant form, timed, respectively, page pain and Pale

blue & blue-green.

Bounding Type Horser Shell, 20 cm, 10E. According to se cles conducted at Picutinay Amount (Ref 1), this

. The commer of the shell was, in peneral, of conseries design, but the shell less's were in two perro, the division loing at the forward udge of the boundlet. In the neer (5) of the shell (Sa spounded the Gorman Monte. Shell Fune War Z 38 and the expelicion charge mormbly (19). This was followed by the ignition tube (18), the dec-matter-beauty assembly (4) and the HE filler (beauting charge). The hand of the shell was provided with 12 line of conventional decign, as ignition carridge and peopolicut increments. The body and bine of the shell was 8 9/16 long and veighed 6.75 list when annuabled. The length of the complete round (including the fin assembly) was 13.1° and the weight was 7.32 ib (See illustration on next page).

The shell was fired from morner in the conventimen but the functioning of the shell was different, as can be seen from the short description gives below.

The impact of the fune, or a sudden slowing up of the abell, resulted in the fiting of the fune primer. The final from the primer Ignited the Igniter charge in the top of the expulsion charge assembly (19) in the forward end of the shell, and caused the burning of the propullent within the capsule. This repeated the shell body and none by sheneing the set acrews (16) which caused the body portion to be thrown mount trute bounce along the ground. A slight dulay was passibly obtained by the pases from the expulsion charge (19) passing through the hole in the ighicion tube (18), then expanding in the cavity below. An additional delay was obtained by muone of the delay-deconator (12), the different elements in the delay-detenator being ignated in the under, of their agrangement. Explosion of the decounter

counsed (uncrimping of the booster pellet (11), which in turn caused the functioning of the burster charge of the

This type of shell was particularly convenient for use over note terrain such as awastplands. Uhere the shell would normally he buried prior so deconation, this design caused

the shell, after deflection to burst in the nir. The compositions of the explosive composition, as taken

from Ref 2, ape given below: A) Instition carridge primer: a) upper charge: Ca silicide 59.4, red lead 24.7 and Ba nitrate 15.9%, weight 0.023 g. b) lower charge: Be nitrate 47; Pb-atyphasse 33 and Ca silicide 20%; weight 0.034 g

B) Ignition carridge propellant: NC (N content 13.1%) 58.3, NG 39.0, centralite 0.8, graphite 0.8, total volatiles 1.0 and unaccounted 0.7%; weight 10.0 g; fquares about 0.0084" chick with langel of side 0,0374"

C) Projectile fune primer K chlorare 51, Sb trinulfide, 44 and Hg fulminus: 5%; weight 0.022 g

D) Projectile, expulsion : therge essembly: h) ignitor cup weighed 9.12 g and consisted of celluloid with N content 8.7%, b) ignicer weighed 0.050 g and consisted of K perchlarace 50, Pb thiocyanate 45 and NC 3%, c) black powder pellet weighed 0.17 g and consisted of K nitrare 77.5, charcoal 12.7 ned sulfur 9.8%, d) expulsion propellant capsule weighed 3.1 g and constant of celluloid with N content 8.7% (e) expelsion propellant, there weighed 13.5 g and consisted of NG (N connect 13.07) 93.9, convenies 2.6, graphics 1,02 cons) valuation 1.2, Spherylamics 0.3 and seaccounted 1.0% forme toods 0.0352" long and 0.0469"

E) Dulay-distanton-bostore unsembly: a) washer con-aloued of phasel-fensalbehyde impropuned jusper, b) delay-drespuner conscissed of (10 g inpore charges and leaf-Ay-allices 17.8 and bloder, of which there was 5.15 of 7.4° mage phenod designablehyde coordenation product and 2.45° of "B" sampe products; c) lower tharge consisted of 0.225 g of Ph chromase 50.2, K perchlarant 24.8, silicon 24.5 and hinder D.SN, d) disc separating delay from detonates connissed of 0.038 's NC 70 and NG 30%, c) decomposes committee of 0.35 g/oppor charge Pb aside...50, Pb styphones 30 PETN 10% and 0.23 g PETN so lower charge:

R) Bursting charge of the shell consinted of about 380 g of TNT or of 65/35 Amount (Am aicense 65; TNT 35%). G) A dioc (15) serving an a gas check and convining of 4.2 g Mg-styphletide, was placed at the bottom of the burnting Charge. References

Curboutt (Carbonite). A'type of paznisaible explosive which may be considered as a attained dynamics with the temperatures of explosion lowered by the excess of carbon it comtains. As a class, carbonies merge through the armoscarbonites with the amnonium nitrate class of explosives.

The first carbonite appeared in 1885 (Bichel and Schmidt inventors) and nince then the carbonites have been medified several times. The composition which passed the Voolwick Test in England contained, according to Magshall (Ref. 1): NG 16, K and Ba sittere 33, wood meal 40.5, sulfuremed beaness 0,25, Co, and No curboness 0,25%. The communicies of few German carb

WW I given in Table 6 were described by Novum (Ref 2) and Davis (Ref 3).

Collude: (Colludia or Comphessal). See Pinatel

Controlle (Contralice) is a type of organic designative of No N'-diphenylures developed beginning in 1906 at the Centralstelle für wissenschaftlich-technische Untersuchungei au Neubabelaberg. Following are compounds suitable for use an arabilizers: Control 1 (Mollie I) (Ethyl centrolite), N,N'-Diethyl

N.N'- diphenyl-ures. Control of El. (Mollit II) (Mothyl control to 1 N.N'-Dimethyl-

N.N'-diphapyl-urea Controlly III (Methylethyl centralite) N-Methyl-Maethyl-N,N'-diphenyl-uses All three contraints are described in the general sec-

tion. The first two compounds were used in Germany and other countries primarily as stabilizers for propellence. When used in amounts exceeding the requirements for a stabilizer (auch as above, about 1%), centralizes act alsoan gelatinizers for NC and probably, at least in part, an Clash reducers (See also under Propellance). 3) J.Kanegis, "Colored Smokes", PB Rept 102,500 (1951) (Included are several tables of colored amoke compositions.

and some references)
(See also Colored Smokes in the general section).

(Industrial or Mining) Emplosives . (Goverbilchespringatoife oder Zielfsprengetelfe) Predering WW S: The lirst application of explosives (black powder) is mining was made, according to Beyling and Drekopf, in 1627 when an Austrian, Canpar Westell blasted some orant Observation Biberstollen in Hungary, The next mine blanting was done in" 1632 near Claustahl, and then in-1045 near Freiburg. Germany. The first bleating in England spok place in 1670. From that time on the blanting of cost and oren, spread to other countries. Black powders of various compositions ware used exclusively until above 1865 when A Nobel introsuced NG dynamites (See under Swedish Explosives). Appear the compercial explanates send in Germany prior

to WW II. the following may be listed: Ammond, Ammon chlorett, Ammongelatine, Ammonit, Bikarbit, Calcinit, Cheddie, Chloratit, Detonit, Donarit, Dynamit, Milotit, Genering-Albir, Generina-Koronie, Goorvina Persolie, Gule dynamit, Loonit, Mied zinnkit, Vorrerderenit, Venterlignonit Werrernobulle, Doctornalit, Verterwangit, Verterwentfalit, These explosives are described briefly in this (German)

poetion of the book promines to their alphabetical order. Some of the rypical explosives used during W. E are given in Table 9 under Commercial Explosives of VY L. "It is interesting to note that some of the consecutal explosives used before WW & were manufactured from surplus milimry supposives and propellants. Aming these explaniest were: Energie, Nitroglyceria Powders No 1 and No 2, Pibris (or Silvis), Pyrelis No 1 and No 2 and Triwestfulit. Bafarearen:

COMMERCIAL (INDUSTRIAL OR MINING) EXPLOSIVES. (GEWERBLICHESPRENGSTOFFE) OF WW M. Among the German, industrial (mining) explosions, the more important were dynamics-type ouplesives commissing various' amounts of a product obtained by sinuring a mixture of glyceria and glycol (usually 60/40). The nimerics of glyceria and glycul is described briefly under Nitroglyceria.

There were generally two types of mining emplosives the relatinized type (such as some domarites) and the powder type (such as calcinies and some descrime).

Following in a short description of their methods of

A) Galaria 1796 puploaives -Procedure

(IGARL

of A weighed amount of collection curron (previous): dried at 50-60" in a rack dryer to a mainture content of shout 1% and then cooled) was introduced into a knowling pan which contained the required amount of liquid DNT, or other liquid airrocompound, maintained at a temperature of 15-20. The mans was attired all the while with a long handled wooden spatule. The kneeding can was a fint vessel made of copper place with an oute q jackes of aluminum for warm water beating. This on

eration was followed by addition of a weighed as of NG-hitrorlycol mixture, while continuing me hand seirring. The resulting gelatin was allowed to stand for 1 hope.

oce: For Am sitrace-type explosives, the planticity was perimes controlled by adding a solution of "geloes". b) The pan was removed to another building where it was placed under the outlet funnel of a sieve through of which the usual solid components of dynamites (such as An or Na nicross, TNT, wood neal, Wei, etc.) were fed. These components were previously pulverized and dry blended in another building. Thile the addition of the solid ingredience took place, the man in the pan was stiered by means of a planetary stiering machanism, which could be lowered or raised as desired. Kanading sime man namelly about 20 minutes.

Note: Several types of mixten (blenders), were used, such as the Desiswercke, Versig, McRoberts and a modified Verner-Pfleiderer

c) The thoroughly kneeded many of palatin and of solid components was removed by a wooden hand specule into wooden transport boxes to be carried to the carridging

Note: German permissible explosives were usually white in color, while the non-permissible were colored red by the addition of caput moreum (Fe O ) in the mining stage,
d) Cartridging was done either by fully automatic machines (such us the system of Niepmann & Co , Gavelaburg) or by seni-automatic machines (such as the system of Bransing). The Brensing machine (made sectively of beans) consisted of a-conicel casing through which passed a harizontal fording sciew. The gelatinized many was introduced into the muchine by hand through the filling funcil. A paper carridge true placed at the narrow and of the conical casing, After a carridge was filled, it was removed by hand and the open and crimped. The diameter of a carridge was 22, 25 to 30 mm. After packing these curvidges into a box (36, 25' and 20 contriduce per box, respectively), the box was mapped in paper and dipped in paraffin. For shipping, 10 bonns and were packed in a case. a) Permissible explosives were mechanically sheathed

with an "active sheath" consisting of NG 12, NaCl 33, and NaHCO' 55%. Originally, the composition of the sheath was NG 15, NaCl 35, NaHCO 50%. The sheath weighed 55 g and the carridge itself 70 g.

B) Pawder type empleatives: To this type belong explosives which contained amalf amounts of NG | such as 4%1, no collection cotton 'and were pulverulent, The mining of the components was done in a tiltable type Verner-Pfleiderer blender which consisted of a brass trough provided with two horizontal brass stirring college tunning in opposite directions.

a) The weighed amounts of the solid compositets (such as Am, Ca or Ne sitrates, TNT, wood ment dye esc, were mixed in a Werner-Pfleiderer blender then the liquid DNT, NG, NGc etc , were added. kneaded for 15 minutes

b) The kneader was then tilted and it charged into wooden casks to be taken to place.

Note: In the case of explosives such as Calcimit I mans could be immediately carridged, but with Donneit ! the mass had to be left overnishe in storage deform care

Cartridging was usually done by fully

machines of the Niepmann type, Dismeter of carridges for Calcinit I was 28 mm, while for Donarit I it was 30 mm. The finished carridges of Donarie I were dipped in perallin and packed in boxes (25 per box). The careridges of Calcinit I were not paraffined but were packed

directly in boxes (32 per box) and then the boxes dipped in paraffin. Table 9 gives some typical German Commercial Ex ploaives manufactured, before and during WW E.

Connecting (or Intermediate) Composition. See under Gaziess Deconators (Electro).

Containers Corried by Planes, German containers may be subdivided into (1) those intended to carry their contents safely to earth and (2) those designed to scatter their contents before impact.

The first type served to deliver supplies to specific locations and generally consisted of a compartment to house the supplies and a parachute to bring the container safely to eath. No explosive opening davices were incorporated.

The accord type could be subdavided into dopable and—nonfopable (retained in the aircraft) containers and also according to content into bomb-consistent, flare container or combination bomb-flare constance.

Dropable containers were fitted with fusing and opening devices intended to release the missiles us from predetermined.

devices intended to release the missiles after a predictermined time of fall from the aircraft. Some of these were open devices which held a cluster of bombs or flares by means of accuring bands, whereas others were closed containers in the shape of a bomb.

"Nandeophib. accurations were, intended, to be used re-

peacedly and they were constructed to carry and scatter a great number of small incendiary bombs. Their release mechanism permitted desired spacing of the bombs in flight These containers could be jettigoned if necessary.

These containers could be jettiaoned if necessary.

The following bomb and flare containers are described in TM 9-1985-2 (1953), pp 93-120:

11 BDE 10 Cluster Container carried five SC 10 or

Beley Compositions (Versignius green industries). A belet description of such compositions in given in the general section.

Shortly before WE, the Germans developed analysis delay compositions suitable for electric decomment. There . (KILO ) and antimony (Sb). Following is a brief description of the author of preparation as conducted at the Traindorf plant: Propodice:

The dry crystalline K permanagene was ground in a special mill (called Kollopies) to a perpicle, sine of about 0.006 min! The antimony, received at the plant in a fairly finely sevided stars, was ground, without in a many emery services mean, was ground, without previous drying or other manman, in a special mill (called Schwingsishle). The resulting powder was sep-around in an mix\*elucriance into fine (griot nine under 40 micross) and courses fractions. The courses fraction yes placed on a vibrating sieve containing 16,900 meabused as coalne Sb. For the preparation of quick never an comme 3b. For the posparation of quick bearing nitrates the fine 58 was used, while for sleer nitrates the cognet meetral was more suitable. For instance a utilities of 36% fine 5b with 64% Klady Leaded into No 10 delay element. (qv) bened in 3-3; to 2-3 necessies, while the nitrates of 35% course. Sb and 64% Killed barned in 6.5 to 7.5 neconds. With a lower content of Sb and a higher content of Killed. the burning time was longer, It ofter to obtain a composition with a Greated delay, the coarse Sb was blended with the first material.

Following is an example of the calculation for preparing a delay composition with a desired delay-

Suppose that it is necessary to prepare 80 kg of delay, composition consisting of 36% 5b and 64% KhhrO which would burn for 4.87 sec in a No. 10 delay element. The time of luquing of course material is 7,50 sec and of the fine 3,50 sec.

All the afrectangle methods in used for computation (as in cultomary in Germany and some other countries of Europe) the enjoyintion will be made by setting up the data shows below:

7.50 1:35 Xkm (course Sh)

3.50 4.85 (80-X) kg (fini) 551

In this configuration 1.35 is the difference between 4.85 and 3.50 and 2.65 in the difference between 7.50 and 4.85 seconde.

From the above, X may be calculated as follows: .

 $\chi = \frac{1.35 \times (80-X)}{2.65} = \frac{1.35 \times 80}{2.65} = \frac{1.35X}{2.65} = \frac{100}{2.65} = \frac{1.35X}{2.65}$ 

2.65X = 108 - 1.35X or X = 108 27 kg (course)

The amount of line material is then (80-X), or (80-27)-

After thoroughly mixing 27kg of course Sh with 53kg of fine 5b, a small sample consisting of 36 parts of mixed Sb and 64 pm of KidaO, was preped and instead in a No 10 delay element. If instead of the desired time of 4.85, 5.15 ner was actually obtained, then this Sb mixture would meed to be corrected by adding some fine 5b (3.50 nec). The amount of fine Sb to be added was calculated being the "rectangle" method as described above and a small namely of new, corrected, mixture was prepared. If the burning time in a No 10 delay plement was exactly the desired 4.85 sec, the total batch consisting of 36% of "corrected" Sb and 64% of KhinO, was blended and pelleted. The pellets were ground and acreemed union nieves of 225 and (961 meshes per cm2, The material which passed the 225 meak nieve and was remined on the 963 meah nieve was removed to storage while the material which was remined by the courses sieve was reground and rescreaned as above. The fine material (dust) which passed through the 961 meak nieve was saved for adding to compositions rensidered to be too slow harning. 2

Before commencing to load a delay alement (av) with the above prend mixture, it was rented as follows: S) Mointure content. A weighted sample of a delay nixture (5-10g) was hented for 2 hours at 110. If the loss of weight exceeded 0:2% the entire batch of delay com-position was dried for reveral house at 50° in a green homes even before it was loaded into delay slowques b) Particle usus of Sb-A-weighed sample of a delay mixture was leached in a Good-type encible with het water to remove the Kidto and the particle size of the dried weighed 5b powder wan determined (Refa. 2

and-31 Note: The method for determination of persicie nine in not described in the references given below.

A differenc type of delay composition commissing of her red lend (Ph O ) and silicon was used for the 200 mm HE morar bomb. The composition in the sleeve was: HC 3.9. red lend 75.5 and silicon 20.6%, while in the pelles is was: NC 2.7, red lend 72.0 and silicon 25.3% (Ref 1)

Durisity of Fragments Test. See Fragments Density Test. Darie Mining Assaclation Testing Station, See under-Gal leries. Testing, in the general nection.

Defenctionsdruck (Blast Pressure). See general section.

Percentions Whighalt (Ability to Desgrate or Sensitivity to initiation). The value is usually expressed by the smallest numbered standard cap reclaimed to initiate the explosive under test. For instance, in Naoun's book Schiensand Speengaroffe, 1927 p 121, it is hald that is order to initiate Ammont ? « No 3 cap is required; while for Ammonit 1 and 5, a No 1 cap suffices, This manne that Ammonit 2 is less weasitive to initiation than are summerines I and 5 The same rest is used in Italy.

Detenotionspesshwindigkait (Velocity of Detenation). See general section.

Detentions betraying Schlagueite (Transitation at Detenation, Striking dimmes), Also called "Sympathetic Detuention". The test is similar to the Gap Test described in the general section. (See also Four Carridge Test).

DETONATORS (Deconatoren); BLASTING CAPS (Spreng-kupseln); Ignitors (Zündern), A short descripcion la given in the general section, A. Stettbacher, (Ref 1) defines detonators (Deternatoren) as reinforced blasting caps which are designed to initiate explosives which are difficult to deconate by some of property blearing cape.

The following military decounters were examined at Picationy Arsensi during WWE and described in Ref 4, p 30; Detenuter, R contained '4 grains of 75/25-L A /L St mixture over 6.9 grains PETN:

Detenuter T contained 3.9 grains of 42/58-L A /L Sc mixture over 10.8 arains of terryl in an Al cap. Both

determances were used in HE hand stenades. Some of the captured German detonators in fuses ( some times called gaines) examined at Picatiany Arsenal

during WWI are listed in Table 11. Following are the principal current commercial decommends

and blasting caper Sprangkapaul A consists of an Al shell, 11 mm long.

4.36 mm in diam-dilled with a 6 mm layer of PETN whiching 0.11 g (base charge) and a 3 mm layer, weighing 0.16 g of 80/20-L A /L St mixture, called in Germany the "Muschange" (primer mixture). Both the primary and secondary charges were press-loaded at \$60 kg/cm

Diethylen eglyeeldinitrate. See Diglykeldinitrat

Diothylnitramine, Hoxenitre. See general section.

Diglyholdinitret Diglykolnitret oder Didt (Diethvieneglycol Dinitrate) (DEGDN or DEGN). Preparation and properties are given in the general section.

Following is a brief description of the German method of prepn as practiced at the Krismonl Fabrik of DA-G: a) 420 kg of technical "Diglykol" (DEG), contg about 1% of sthylenegiyes and about 0.1% of water, was see dlowly with stirring into 1218 kg of mixed acid consisting of 65% airric atid and 35% sulfuric acid. The acid was cooled to below 25° by brine circulated in cooling coils. Teral time of aittation was 22 minutes. Note: A great excess of airric acid was used in order to retaid the decomposition of the otherwise extremely unatable apent acid. While the NG apent acid remained fairly a stable for days, the DEGDN acid had to be worked up at once since it decomposed mpidly on standing.

b) After the reaction was complete, the mixture was 'cooled to 15° and cransferred to a separator where it was allowed to stand for 7 minutes. The apent acid (mitric acid 8-9, sulfuric acid 64-66 and nitrated products 4-5%) separated at the bottom, while the oil collected as

the upper layer

(b) The spent acid was then transferred to a "denitrator", while the oil, was run into the "primary washer" contg 300 litera of water stirred by air. The resulting acidic wash water contained an appreciable amount of nitrid acid and was Direct designated

d) The oil was iun into the "main washer" to be treated (with vigorous air-stisting) first with 500 I of cold water, then with 150 lof 5% ands ask sols, preheated to 60

and finally with 500 l bf cold water inhoratory and if the KI test at 82" was not less than 20 min the material was considered to be satisfactory s for use in the prepa of the so-called Rohpulvermasse (q v ).

The yield of DEGDN was 710-715 kg or 170% of the DEG used; theoretically it should be 777 kg. .

The purified DEGDN had the following properties: light yellowish oil, d.,1.38 to 1.39, N content 14.1 to 14.25. ir p below - 10", by (decomp ca 162" and puifs off ca 200°), calorific value 1070 kcal/kg (vs 1715 for NG), water culculated as liquid, impact sensitivity with 2 kg weight 160 cm (vs 4 cm for NG), solubility in water ca 0.4% at room temperature, and volatility ca 4-5 times more volatile than NG.

DEGDN was used in the so-called . "cool" propellages, such as "G" Pulver and "Gudoi," Pulver, References: 1) O.V.Stickland, PB Rept No 925 (1945), p 57

2) A. Stettbacher, Spreng-und Schiesstoffe (1948), pp 61-2 (See also CIOS Repar, 28-61).

Dimethylammenium Mitrota.Sec Di-Salz.

Dimethylethylenedinitramine (DMEDNA). Described in the general section, It was investigated by G.Romer. PBL Rept #5,160, p 14 as a component of some explosive compositions, such as:

- 1) DMEDNA 12, RDX 50; R-Sais 36, DPbA 1 and
- unaccounted 1% 2) DMEDNA 2.5, RDX 96.5 and DPhA- 1.0%

Dimethylnerrowies (DMNA). Described in the general section. It was investigated by G.Romer, PBL Ropt-\$5,160, p 13 as a possible addition to R-Sals in order to reader it castable at temps of TOO, or lower, it to render it castable at temps of IOC, or lower, it was decided that incorporation of about 10% at DMNA. was sufficient to give satisfactory results.

Diau. German abberviation for Dinitronaphthalene

Dinitronilla (Dinitronnillas) (DNA), Described in the general section under Aniline. The Germans used BNA during WWH as an addition to TNT. The resulting explosive was rellow in color, less nowerful than TNT: and much less sensitive to impact of friction. is produced larger projectile fragments than did TNT [Allied and Enemy Explosives, Aberdeen Proving Ground (1946), p 901.

Dinitronisel oder Disal (Dinitronnisole) (DNAss) See general section under Anisole: was used by the Germans in some explosive compositions, such as "Amatol No 40" (q v ).

Dinitrohenzel (Dinitrohenzene) (DNR), See sesecal section under Bentene. It was used by the Germans as an extender for TNT and as a desenitizer for some explosives, such as RDX. The addition of it to some high-melting explosives tendered them suitable for cast londing [ Alfied & Enemy Explosives, Aberdeen Proving Ground (1946), p 111 ].

Dinitrodiglykel. See Diglykoldinitrat.

Dinterachlerhydrin (Dinitrochlor phydrin) (DNCH or DNCIH) in described in the general section under. Chlorohyura-Dintreglykel (Dinitroglycol). See general section,

under Glycol. Dinterenaphehalin, Dina, (Dinitronaphehalyne) (DNN). San

general section under Naphthalene. It was manufactured during WV I, tagether with trinitrosaphthelene, at Sentia Fabrik at Panlubica, Czecho-Siovekia, and nied in some composite explosives. Reference o:

Dust Fuse, developed during WW II it the Rheinmethil-Bornig, laboratory, was based on the principle of charging a condenser electrostatically by means of a dust field. The fuze was located in the nose of a bomb or a shell. Prior to dropping the bomb, the plastic cap covering the alits on the head of the fuze were removed. As the bomb fell, the az stream entered the fuze via the slits in the puter generator cose, . This action disturbed the talcum powder and created a dust cloud in and around the forward part of the fuse. When the dust particles came into violent

the charge leaked from the condensor, the remaining therese

The fuzze was used in some shalls, such us the 37 mm and some smaller bombs, such as the SD 4 and SD 16. Reference: TM 9-1965-2 (1993), pp 190-2.

Dunit (Dunite). An explosive made is Germany before WW1 and placed on the British Permitted Line in 1914: NG 31-33, collection cortem 0.75-1.3, NaNO 27-29, wood ment 8-10, Am oxalare 28-31, moisture 0 so 2.5%; max charge 12 uz, bellistic pehdulum nwing 2.45° vs 3.27° for British smadard Gelignite containing 60% NG [ E.Barnett, Explosives, Van Nontrand, NY (19)9), p 136 ].

Dynamite (Dynamite) According to Scotthacher (Raf 2). dramates may be subdivided into the following groupes a) 'Gubrdynamit (Gubrdynamite), b) Sprenggeintine (Blanting Geintin; c) Gelatine-dynamit, and d)

Sichgeboienaynamie (Safery Dynamice) According to Markhall (Ref 1) the following three dynamics given in Table 14 were nutherized between Wel and We f for use in German coal mines: 4

EDD. One of the abbreviations for Ethylesediaminedimitrate, called also DIAMIN.

Effective Culculated Colorific Values of Propullanta If it is assumed that for w certain mappie velocity and a given projectile, the product of the charge weight and enlorific value of a propellant in countries, then by knowing the calonific value and weight of a plon pellant, it is possible to calculate the calorific value of a second propellant of a similar nature (if its charge weight had been previously determined experimentally). For instance, if for one propellant the values were \$20 heal and 4.3 kg and for a second propellant X heal and 6.2 kg thenr -

x = 820 x 4.3 3526 - 570 kcal/kg.

This may be considered as the "effective calonific value" and it differs from the value determined in a calorific bomb, which is usually higher, e g 690-700 kcal/kg, for the example cited immediately above. In calculating the life of a gan barrel, it was con-

sidered preferable to deal with the "effective calorific values" than with values obtained in a caloralic bomb. (See also under Erosion of the Bore and under Energy Content of a Propellant Charge)

Electric : Fuke (Elektrischer Zünger). The development of electrical time and impact fuzes had been carried on in Gesmany since, 1926 and the greater part of the work was don't by the Rheinmetall-Bornig Co. under the direction of H.Rhulemann, The original object of the development was to produce for projectiles as electrical time fuze which could be set at the instant of fizing, However, before this work was completed a successful electrical bomb fuze was

The inner part of a typical fuze consisted of two sections: a) The upper section, called the swech block, was molded polystyrene which had been machined to take various plunger contacts, the trembler switches, and in some cases the long delay igniter bridge.

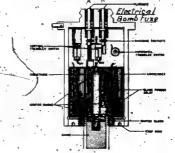

b) The lower section contained the storage and firing condensers, the resistances and instantaneous and short delay igniters. All these items were held in place by a black bitumen calking substance. The condensers were constructed of metal foil strips separated by war paper, all wound on one cardboard cylinder. The carbon resistances were usually located inside. this cylinder. Some fuzes, as for instance E12. (9). described in this section under Aerial Burst Faxes. contained the glow discharge tube, also called the long delay, cold cathode tube. The iguager block (isted into the bottom of the fuze and contained the black powder (lash pellet, the cover with three perforations leading, from the pellet to the igniter bridges, and the short delay train,

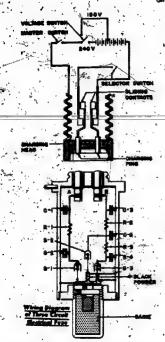

The electrical bomb fuzes were aither impact or time Following is a brief description of operation of a three

circuit electrical impact fuze illustrated on next page

As the bomb was placed in the plane, a charging head was clamped on the luse head. The charging pins contacted the plungers and depressed them so that they could make electrical contact with the storage condensers. The two charging pins were connected to the sliding contacts located in the charging arm. These contacts closed when the bomb had fathen from 1 to 3 inches from the rack. This prevented charging of the fuze while the bomb was still in the aircraft. The two sliding contacts were connected to the positive carminal of the 240 volt, battery. The B plunger circuit was coppected directly while the Aplunger circuit was connected shrough, a selector switch 'which had two positions t open (MV) with delay, and closed (OV) without delay. The battery was rapped at 240 and 150 voice and the two leads were run to the voltage switch. This switch was set at 150 v for level bombing and at 240 v for dive bombing, but it could not be used to open the circuit. The voltage switch was connected to the master switch which was used to iettison the bombs. The master switch was connected to the charging head which contacted the fuse head and completed the electrical circuit through the fuse body to the storage condensers.

Prior to the release of the bomb, the master awitch was closed completing the circuit from the barreries through to, the fuxe except for the sliding contacts in the charging head. When the bomb was dropped, the charging arm was extended, causing the aliding contacts to meet for about 1/3000 of a second, the ground return circuit being through the fuze body, If the selector switch was closed, both plungers received the current and the storage condensary C-1 and C-3, were charged. The charge of C-1 leaked slowly through the resignance Rel into the firing condenses C-2 (The time required for the current to pass from C-1 re-C-2 and build up sufficiently to fire the igniter is called the arming time) At the same time the charge of C-3 leaked through R-2 into the firing condense; C-5 and vlso pare of the current leaked through R-3 into the firing condenses C-4. On impact, the tremblers of switches S-1, S-2 and S-3, made contacts with their cups, causing the current to flow through the igniter bridges. These were thereby heated and fired the starch compositions surrounding them. When all three igniter bridges fired simultaneously the instantaneous bridge fired the flash pellet and deconated the bomb through the normal explosive train. The short and long delay trains started to burn just at the instant of

If the selector switch was held open, then the churce, west through plunger B to-the storage condenser C-F and acthing passed to the instantaneous circuit. The circuit through the resistance F-2 or the stantaneous Co. the resistance R-2 to the condenser C-5 became through the reasonace N-2 to the consensor 1-2 became assess before the circuit through both resistances N-2 and R-3 or firing condensor C-4. If the bush high been dropped from an altitude of less than 1170 fr, the letter circuit would not be assed before impact and the ignitive bridge associosed with the trambler switch S-7 would fire the long delay paller which acting through the explosive train the fune would detounte the bomb. If the bomb was dropped from an akitude greater than 1170 fs, best circules would be sensed before impact, but because of the sheres

delay train used in conjunction with the trembler switch 5-5. the short delay would initiate the final explosive train

Electrical time funes (ElZcZ) contained ensentially the same baric parts as the electrical impact fuses (ElAZ). sexume that the trembler switches were replaced by a succum tube which became conducting of a critical prederemined voltage, At the instant the bomb was started on its traectory, an electric charge was put on the storage condenset, and another smaller charge was put on the firing condenses. The time netting of the fune was adjusted by varying the sames of tharge placed on the firing condenser, During flight, but of the there on the storage opndenses, leaked through the senintor to the liting condenses. As the charge on the fixing condenses increased, the volume acrous the vacuum tube also increased; When the firing voltage of the tube had been reached, the firing condenses discharged through the tube and the imiter bridge thus firm a the fuse.

Electrical bomb fuses are described in Refs 1 and 3. and new linead in this work, ander Page. Some of these - funes are described in this work under Acrial Burst Funes. An electrical time fuze (ElZtZ S/30) for use in proecules is briefly described in Ref 4, pp 605-8. Prior firing the projectile, the fune was charged nither by hand or by a machine, by putting 300 to 500 volts action the shell and an insulated contact which put voltage on the samelar scorage condenser. The charging could also be done by allowing the "feeler wire" (connected to the electrical circuit of the fuze) to contact the "muzzle charging ring"

ge 'the projectile was 'leaving the gus. A brief description of a muzzle charging ring is given in Ref. 4,7 606.

A device, described in Refs. 2,9-422 and 4 p. 623 as the electric fuzz, 'ERZ 39, was used for igniting the black' powder chargetyphich set off the propellant of 15 cm and 21 cm rockets. This device is briefly described in this ,

work under Rocket Propellant Igniter. (See also under Electrical Igniter and under Igniter).

Empfindlichkeit girgen Wome (Sensitivanean to Heat), also called Chemische Beständigkeit (Chemical Stability) is described by the general section under Stability.

Energiogobalt des rouchlosen Pulvern See Energy Content of a Propellent Charge.

Energit (Energite)-According to Nabum (Ref 1) . . Energit was & connercial explosive manufe after Wat by Nobel's Denamit A -G. The explosive was prepd by wet grinding various kinds of surplus double-base propellants in Excalsior" mills between steel discs, to a particle size of 0.5 to 2 mm, followed by drying and patking in carridges 25 so 30 mm diameter, This explosive was used to a great extent in porash mining.,

According to Pepin Lichelleur (Ref 2). Energit and Triwestfalir were industrial explosives prepared by bleading a smokeless oppositiont (left as surplus after WW B) previously wetted with about as equal- mantity of a solvent auch as furfurof or accrone, with liquid aromatic autrocompounds and oxidizing agents such as alkali nitrates or chlorates in a kneader. The atmosth of these explosives as, determined by the Trauxl rest was 330 to 350 cc; velacity of detonation 3000 to 5000 m/ eec. References

Energy Content of a Frepellent Charge According PB Rep 925 (1945), p 82, the energy content is equal to the charge weight of a propellant multiplied by its calorific value. For a given projectite and a given initial (murrle) velocity, the energy concent is constant and independent of the type of propellant used. For instance, if for a certail initial velocity of a projectile the charge weight of a propellant with a calorific value of 820 cal/g is tol kg a propellant of 570 cales (such as a meroguanidized propellant) would require a charge of 6.2 kg. | See Effective Calorific Values of Propellants )

Erasianius a Priming and Initiation (Literionafreie Zundung). Priming and initiating compositions containing mercuric fulminate and the chlorates (such as KClO.) have been known to cause considerable ground of gun barrels. In 1904. N.Zinaler of Switzerland, therefore, proposed that Ba saits' such as the attrace be substituted for the chiorace saits. These new compositions were known in the industry as "rostifere Zundungen" (rust-free primers). As these substances were not entirely satisfactory, further search ceaulted about 1930 in the invention of compositions based entirely on organic compounds, such as Tetracene (Tetrasen). There substances, called "erosionfreien Sinonydsatzen", were manufactured before WA I by the Rheinisch-Westfallische Sprengstoffe A -G .in Numberg.

Erecton of the Born (Etenion der Gewehrliefe, Bubenh. natural oder Bedressbrennung). Evenien of man is dentribed briefly in the general section.

In this sestable a abort account in given of recent Gos-man efforts to reduce the session of their mean.

Dog so the fact that the armet of tanks and skine during WWE was made thicker and thicker and the speed of the planet protect and present, the mutale relocity of gunn was increased to ad much as \$300 fa/age. In order to achieve such velocities if was necessary to use propellages of high ballistic potential, such ne those containing NG. As these propellency were "hist" (calculfic value about 950 kcal/kg) hey could excusely eventual time lowering the life of a pur considerably.

For insuace, the life of Att-mos using a 950 heal/kg prescriber was only 1700 firings and for a \$20 kral/kg propolings about 3500 firings. Even before this number of firings was reached the gas became less effective because of the secone of spaces between the walls of the barrel and the prejectle. This occupe of passes not only reduced the chanker present thes change reduction in number to oclay of the projectile with consequent reduction of range and paintention) but also coused piccoulve musule flash. As the doctores in efficiency of an older fee in usually one-photos of territories the propelloss theres, this land to a still be about the flash. In order to reduce the clash In such increased charges, more and more potassion soliste (or other flesh reducing name) had to be incorporated. As their upones are inser materials; they diminish the officiency of the propullant.

riding of a yea, the result of which is always usestinfactors secucion of the shell (spin) with associated fune failure. Particularly had breaten, was obtained with high velocity some (such no these with a muzzle velocity of about 3300 ft/sec). For them the use of propellence having calerdic value of \$20, or 950 heal/kg was absolutely prohibitive and it was necessary to use cooler proprillages.

Duction the fact that charing the last war Germany suffered considerable sheerage of averlehardening merals, such as Cr. Ni, Ma, Me esc' required for making modern gun barrels, and due so the shortage of labor and in some Cases of ordinary strel, the replacement of groded man was quite a serious problem. Fortunately for the Germans, a series of "cool" propellents or low calerific value propellents were developed, such as the "G" Pulver by Gen Gallwitz and the Gadalaulver by Dynamit A.G. The use of these perpellenen peolonged the life of a burrel to an many as 17,000 fitings. This high figure was more than the Corners over espected to achieve. As was mentioned previously, the previous NG propellant with a calorific value of 950 kcal/kg permitted a sunimum of 1700 firings, when used in AA guas. When the German's decreased the calquific value of some of their NG powders to shout \$20 km1/ks, the number of Stings was increased to about 3500. Therefore, it was calculated that each ardection of about 130 kcal/kg should double the life of a gua. When Gon Gallwitz prepared his "cool "G" propellages, the talgrific hanh decomination

values of about 690 kcal/kg. As it had previously been found that a reduction of 130 heal/kg doubled the life of a gun berrel, the Germans thought that the new propellants would permit about 2 x 3500 = 7000 firmum. lastend of this value, they unexpectedly obtained 15,000 or even 17,000 fixings. If previous German assumptions were sight, then the new propelients should possess calorific values of 550 to 570 hcal/kg and not 690 hcal/kg as the cultrific bomb showed. The values 550-570 heal/he wife considered as the "effective entoringed colorifi values". Those values were used by the Germans in newference to the calorific bomb values, such as 690 kcal/kg. Ernotzdynamit. (Substitute Dynamits) in may dynamics is which a large proportion of NG is substituted by home other explorive in such a manner that the resulting composition, in equal in scienach to the original synamics [P. Nacum, Schieve-and Spresqueette, Strinings, Deceden (1927)

Erems-Goodens (Substitute Shell), Due to the shareage of steel and other memle, the German, during WV L. develoced, among many other substitute amonalcies itume. a port of HE-Shaperl shell which was made of a combinetion of uncrete and seed accup. These shells were used toward the and of the war. [ L.E.Simon, Gomen Research in WWI, Wiley, N Y (1947), p 190 %.

ERSATZSPRENGSTOFFE (Substitute Explosives). Due m the acute shorman in Germany of THT and other ausdotic nimocompounds, neveral industriate explosive mixtures were developed and used during WVE. Many of the "Emails" explonives were developed at the Krimmel Plant of Dynamic A -G others at Christiansurds and other plants - 24

- In the preparation of various melp-leading compe the following wends were noticeabled
- oc a) Substitution of RDX for part of the THT in an b) Substitution of DNB for TNT in ametole
- c) Substitution for TNT, by airreproductions such as
- disitrodiphonylamine, henen itrodiphonylamine, trinimonylene, disitrosophthalene, etc.
  d) The use of low selting hydrous inormalic nicese
- compounds, such as Ca, K and Na nitrates, so permit the reduction or replacement of TNT e) The use of Al powder an an ingredient
- f) The use of mincellanious organic ingredients such as oven, PE (pentserythrist), manidise nitrate, ethylane-
- disminedialune, methylaminenius te erc a) The use of sodium chloride (up to 60%) at of so-called Scheidenehl" ( powder consisting of a minuser of Ca and
- Mg silicants) in order to reduce the smoont of THT. Most of the explosives containing these substances

are much less powerful and brissus than TNT alone. Note: From German documents, it appears that the critical period with regard to the supply of explosives and assess action was reached in August 1944. From that date, serious shortages occurred, it was in September 1944 that on account of the shorings of NH NO, the High Command ordered the use of mixtures of 50/50 TNT/MaCl, or even 40/60 TNT/ NaCl. for loading shells. However, previous to this, mititures of 50/50 TNT/NaNO, (Sodatel) and 45/40/15 TNT/

NaNO\_/Al had been used to a considerable owtone. Table 15 lists the principal "substitute explosives" used by the Sermona duting WML.

To this table may be added the following: a) An explosive composition prepd by LG.Farbeninduratic by aimsting a mixture of MNX, methylaniline and MNT. The aissased product consisted of TNX 45 sected 50 and TNT 5%

b) As emplosive mixture of the Krummel plant of D A -G contained TNT 45. Am nicrate 40 and Al powder 15%. le was autable for cant-loading bombs, grenndes and

c) An explosive minture of the Christianstade blant of DAG was a slurry of 70% Ca(NO.) 4H O and 30% TNT.

The following explosives, listed in the German section under fieir proper names, also belong to Ersatzuptengatoffe : Amerol, Austrianal, Ammonit, Di-Salt, Fillers Nos. 13, 134, 13-111, 19, 20, 52, 56, 57 (or Abonachit), 60, 61, 64, 70, 84 and 88, Forinit, HDD, MAN-Salz, Myrol, Pil-Salz, Tetanspreagatoffe (TeNMe explosives). Terramethylnitraminoret mmethylmethane, TETRA-Salz, Trinitroethanol Perchlorate (and in the sensemble section under Perchlorates) and TRI-

In addition to the explosives mentioned above, before and during WD I, the Germans developed and used several new employives and employive mixtures, which cannot be called "autorinices" (Frantzenrenestoffe) because they were more powerful than the previously used military explonives, such as TNT and P A. These new poweful explonives included PETN and RDX, as well as various neintures containing these aubitances. References:

Emiliation (or Sweeting) Test (Autachwittengsprobe). This test was conducted in German essentially as follows:

A 20-z sample of TNT, melted and cast as a cylinder 18 see in diameter, was placed with the better part on a sheet of special Schleicher & Schille filter paper resting on an aluminam plate. As a reference standard a similar pellet of/Grade A TNT (sp 80.4 to 80.6") was placed about 100 mm away. The ensemble was placed in an over and left there for 6 hours at 72". The diameter of the circle produced by the exidete was separated and if it was not greater than 35 mm the TNT une considered an Grade A. Any diameter between 35 mm and 70 mm /ven reassisted as Gmde B (a's: about

In addition to those rwa gorden the German manufacture Grade UK (unbeyomlining - very scallined) with a . a p. w

30.7" to 80.8% 30.7 to 30.57.

Near: In inserenting to the char suffice (attlies) rediced.

THY resulted a my of about 40.5° in code: in order in pans the Garman vanishation rous for Garde, A, while TNY produced by a nivine acid refining secorcie, developed by Dr. Wille of Allender Plant of DA -G , passed the Grade A tout with Alliender Plant of D.A.G. posted the Gode A test with a p of only 90.2. This may be explained an indicate in godes to obtain a parentelly nec-archite TMT it is necessary to resource the high 16 of the two pincipal importa-tion of crude TMT; DMT and the imposers (but such passes) of TMT.—Of three imposition, the DMT being of low-sp tonous higher candition and in the most mederals the As these imposition subsets of the location of crystals of subsets. THT, the Simplest way to move them is to time the TRT, the illustratively by tokeney them in its frame the expensal with a liquid high, local either sent with the imputition of dispersion without stracking or discovery them without stracking or discovery dispersion. ITML is has been claimed that while the faint, acid peopled resource both the DRT and the indirect of TRT, the sulfie (settling)-mented resource only the immunity in the large means of the CRT and the thing of the DRT by the CRI acid view on some or the ball of the DRT by the CRI acid the set of the case such a large means of a cilit that the DRT would he washed out mechanically sogether with the isomers. Such treasumer would give a high a p (ney 50,6 ), but it is murconomical because a significant amount of alpha TNT is removed tomether with the impurities, if the TNT purified by selline has a high ap (say above 80.2") and it still exades, there is a possibility of the presence of some DNT in addition to inomers of alpha INT, and other imputition.

It is claimed by the inventors of the aitric acid parification process, that practically no danger of exadation exists with 80.2 TNT purified by their method because the bulk (or nearly all) of the DNT has been removed and if the sp is still lower than that of pure TNT, it is due to the presence of imperities which are less liable to cause ou-

Fourtpotence', (First Cartridge, Tank Cartridge) . Hollow charge antitank rocket grenade fired from a tubular discharger. The smaller model. Fourtputrone I was laser called Penterfeust 30, Klein and the larger model, Faust-

persone 2, was called Personnest 30 (Ref 1).

The avenade for the Faustratous consisted of a large war head (contg HoC-HE) and a cylindrical body (tube) terminating in a suil to which were attached four apring steel stabilizing fine. The tube contained a base fuze and a booster. The projector was a simple metal tube in which was located a propellent charge contained in a waxed cardboard cylinder held in position by a set screw. On the opposite side of the set screw was an igniter situated below a flish hole. On the top of the tube was a firing mechanism with a release button, firing pin and spring and a salety catch. A folding sight, adjustable for a range of, 33 yards, was used for siming. The grenade was armed by unscrewing the tail and inserting the booster and fuze, open ends facing each other. The fins were wrapped stound the tail and the cylindrical part of grenade was inserted lete the launcher tube. The pressure of the fine against the inside of the tube served to hold the grenade in position. According to instructions furnished with the weapon.

the fitting mechanism was cocked first, the ensemble was placed under the right arm (the laft hand supporting the forward part) and the sight adjusted to a range of 33 yards. The weapon was then fixed by depressing the release button, thus allowing the ortikes to go forward. When the wespon was discharged, the propelling charge drove the grenade towards the target, while, a portion of the games blasted down the rear of the projector tube thereby offsetting the secoil. The back biast of the gases resulted in a jet of flame/6 to 8 ft long at the rear, which made it extremely

deaprose for sevone so stand behind the firet-The tube was discarded after firing.

The original models (Faustremone 30 and 30 klein) were very much feared by the soldiers assigned to use them, but the improved forms (Panzerfaunt 60 and Panzerfaunt 100) were sale to handle. The model '60 weighed only-13% lb and could be fired standing, kneeling or pront. is had as much flexibility as an ordinary ziffe.

The hollow charge of the war head was capable of penerrating & of homogeneous atmor plate and within the firing range there was no practical variation in the penetrating power,

ing power.

New models were provided with confirm projectors, carrying larger propelling charge, which allowed the range to be increased to 150 meters (Refs 4 & 5) (See also 44.5 mm Recoilless Greande Dischargei, under

Weapons). a Note: Smith (Ref 5) calls Faustpatrone the "German Recoilless Geenade Discharger". ' References

FILLER OR BURSTING CHARGE (Füllung oder Füllbulver) (Fp oder FP). Following is a list of explosives used for

filling projectiles. These explosives are designated as Filled to I, Filler No 2 etc. Some of them have prefixes such as Fp 02 which means TNT, or Fp 30/30 which means 50/50 Amazol. Filler No 1 (FpO2). TRT pressed in cardboard or metal containers; was used for loading shells, depth charges, land mines, or for the prepa of demolition charges

Filler No. 2 (Grf 88), P A pressed in cardboard or mem! containers: was used in shells, land mines, denth and demolition charges Filler No 3 (No). PETN pressed: was used as the

deconager and as a filler for grenades and small shells such as 20 to 50 mm Filler No 4 (Fp .OZ). TNT loose in paper containers;

was used in archades Filler No S Granular P'A ; was used as a bursting

charge in stick hand grenade 24

Filler No 6: TNT/Nax + 95/5 in blocks in cardinard containers Filler No 7 (Fp O2). TNT pressed; was used for loading

shelis, muxiliary boosters, bombs (heavier than 50 lbs) and chemical ammunition Filler No 5 (Fo D2). TNT, cast, was used for loading

tiE shelle Filler No 10. to O2 + Fp 3 + Fp 10, pressed; was used

Property of the Bally of the

was need in AP shells Filler No 12, Fp 02 + Fp3 + RDX/Vex - 90/10, pressed in continued containers; was used in AP shells Nose: la the above mistures Fp O2 mensu pure TNT while

Fp 5, Fp 10, and Fp 20 meen TNT plus 5, 10 or 20% wan respectively. In AP shells, the filter varied with the section of the shell. The higher wax-content TNT was in the same where the shock of impact was more intense. shorand, the because surround constanted of pute THT Filler He 13 (Fp 40/40), NH NO, 40 and TNT 60%; corresponds 'to Americas 40/60 Ameral. Its imposes

density rest gave 39 meters vs 40 m for THT. It was case leaded in GP, SAP and A/P bembe and shells. Fille No 13e (Pp 30/30). Same as, 50/30 American Amatol, its fragment density was;35 m vs 40 m for TNT; it was case leaded in GP bombo and land mines such an Tellessies

Filler No 73-313. NR NO 270, TNT 20 and Al 10%; was used for filling CP Make. Assider mixture consisted, of Am niwate 74 and THT 26%

Puller No 14 (Fo OZ) . THE cast was used for filling GP. SAP, AP and A/P bombs.

ne is the present form To O2 was also used as no our liery become in all HE bumbs over 10 kg and as a burnter in chemical passantion

Piller No 15. THT 90 and Al 10%; was used in the shells of mountain artillers

Filler No. 36, TRT cast the an aluminum container + PETR/Vax - 90/10 as an explosor; used in some shells and as a core in subsparing miner;

Filler No. 17. TNT/Al porder (90/10) case + PETN/ Was - 90/10 no no exploder; uses not specified

William No. 474. Marrist of DNAnn/Am niwers/RDX 34/32/14, with biscuit of Am sittee/Ca airross/RDX/ PETH/combined water - 46/21/20/9/4 Filler No 18 (Pp 03/NS-80/20). THT 80. RDX 19 and

Names over 1%; was used in some shells Piller He 19. Am nitrate 35, TNT 35 and Al 10%; was, used in none HE shells (mountain trillery) Piller He 20. Am nitrate 53.5, EDU 45 and Al 1.5%;

Filler, No 21, Am nigrate 60 and TNT 40% with a comof pressed TNT pullers

Filler No 7. TNT 35. Am nitrate 50 and DNN 19%: make more as an extender for INT in name remunities. Pilter No 24. Cast P A ; was used as a bursting charge in some shells, as 'a standard burster and as a subbooster in mines when hi.F. was used as the initiator. Filler No 27, Fo 02 + Fo 10 (present); was used in AP shells and SAP

Filler No 28. THT/Was - 90/10 + PETN/Was -- 90/10. pressed in blocks in staminum containers; used in some

Filler No 29. Fp 10 Layers pressed in shall

Fp O2(cryscallized) Fp 10/XCI-"0/30 Fp 10/EC1-50/50

Note: Ref 3, p 286 gives for Fp 29 the following composition: Fp 10 + TMT (crystallised) + TMT/wax/EC1-63/7/30 TNT/wax/EC1-45/5/50 4 ECL: prepard in blocks in card board containers.

Filler No 30. Fp O2 + Fp 5, pressed in shells. Note: Same as under Piller No 12

Filler No 32. PETN/wax-90/ Filler No. 32. PETN/wax-90/- messed in wax paper; Filler No. 32. PETN/wax-85/97/ were used in A/T mines and as smadard sub-booscere in all kinds of annunities

Filler No 34. PETN/wax-76/30 was used as filler of special shells

Filler, No. 34. PETN/was-60/40; was used an filler of spēcial skella

Filler No 37. PETN/wax-50/50; used an above Filler No 38. PETN/wax-35/65; used as above

Filler No 7, PETN 91.5, wax 8:5%; was used as subbaceter in bomb gainer, in 80 min-CM shells and in some 30 mm and 37 mm shells

Filler No 7, PETN/wax-82/18; was used in 37 mm ADRN and APMB shalls .

Filler No 7: PETN/wan-87/13; was used in 56 me #Iller, No 7. PETN/wan-92/8 5 2%; was used in A/T

14.1 50 cm TH, 105 min HE How as a detenator surrenad in HE shells (50 and 75 mm) and in some 75 mm and and \$5 mm AP shells.

Filler No 42, Pentul (pressed); was used in HE shells. Filler He (41. Plautic explosive consisting see PETN and mineral cill was used in some HE shalle

Filler No 45. PETN/RDE-50/50, pine 30% was; similar in properties to PETN/wan-70/30; was used in some special projectiles. Asomer mixture commined ROM

50. PETN 35, and wen 13% " Filler No 32. An assetti-type explosive containing DHS 50, MH NO 35, and RDX 15%; yellow solid; could be cast; emplosive, properties similar to these of 50/50 ametal; toxic (due to the presence of DNB). Was used in 50 kg GP and SAP bembe. (Ref L: p 135). Filler No. S2c., 'An anniel-type explosive commining such Co nizuwi 30, Net NO., 55, RDR 138; was less powerful and briants than 50/50 Anniel but of about the name sensitivity. Was used as a hiscuit filling in the ness of parachute and sohet hombs, with a nurseund of Filler No 52a

Recomition Handbook (Ref 3, p 286) gives the following

papoeitians for Fillers No 52 and 52At-Filler No 12, Marrie DRB/Am airrass/RDX - 47/36/15 with a biscuit of Am nitrote /Ca nitrote/RDX/PETN/ Combined water - 46/21/20/9/4

Filler No 52A, Marrist DNB /Ass misente/RDX - 50/35/15. with a biscuit of Ass nimme/Ca nimme/RDX/PETN/ Combined water - 46/21/20/9/4

Filler No SZA. Herriz DNB/Am sirrere/RDX - 35/30/37. with a biscuit of Am nitrace/Ca aigrace/RDX/PETN/ Combined water - 46/21/20/9/4

Filler No 56 or Denorit .. Am nitrace 67-80. TNT 12-25. NG 3.8, collection cotton 0.2 and regetable ment 4%. it was a vellow, semi-plastic substance personning nearly the same explosive properties as 90/20 assess), except the it was slightly more sensitive to impact and rifle build terms it was used for filling some hand

greendes (Ref 1, p 90) -: Note: Ref 3, p 287 gives the following composition for Filler No 56, Am nitrate 80, TNT 12, NG 4 and tye flour 4% Filler No 57 or Abonochi? 2 . Am sizzare 64, K .or No mitrate 5: TNX I3, collection cotton 1, and Nauchiorage 19%: was used in some menades

Note: Ref 3, 'p 287 given the following composition for colledion cotton/charcosl - 64/3/14/17/1/L. This composition was called Monachit.

- Filler No ?- RDX 8, tech Ca nitrate 5, Am nitrate 55, EDB 30 and wax 2%, white substance:, said in some

ammunition (cast loaded), its explosive properties were comparable to 50/50 Amatol (Ref I, p 134) Filler No 60. Pressed TNCB; was used as a shell filler . Filler No 61. Cast TNCB; was used as above ...

Filler No 64. Cast-leaded mature of TNCB 60 and Am niusce 40%; white to brownish color, mp 81-82, partially sol in w. sol in alc and accone; explosive properties were similar to 40/60 Amatol; hygroscopic and namable, very toxic; was used as a shell filler (Ref.

Filler No 66, PETN/wax - 50/50

Filler No 76, Pressed TNB; was used in some primers Follow No 83. EDD in mixtures with nome HE, to permit

cast loading Filler No 84. EDD 55 and Am ustrate 945%; was used in name shells

Filler No. 84. EDD/RDX/Was - 46/18/36, pressed in blocks wrapped in wax paper and placed in an aluminum

Filler No ? (Fn 30/70). TNT 30 and Am nitrate 70%; was used in some A/P bombs'

Filler No ? (Fp 5/95); TNT 5 and Am nitrate, 95%; une is our known

Filler No BE (Fp 40/60), NH NO 60 and TNT 40%; was used is some shells provides and radio-guided Filler No. 80. General name of cast mixtures based on

RDY Filler No 90, General name of pressed mixtures based

on RDX Filler No 91-H5, RDX 95 and Montan was 55; was used

in sub-boosters and boosters ; Filler: No 92-H10, RDX 90 and Montan was 10%; was used in boosters Filler No. 7 (M. 10.3), RDX 89.7 and Montan was 10.3%;

was used in 75-pm AP shells. Filler No .? (M 3). RDX 97 and Nonian wax 355 was used in bobeters for tropical countries, to replace PETN/mak mirenes

Filler No 95 (H/Fn O2, SRDX 60 and TNT 40%; was used in some shells (press-loaded) Filler No -101 (Fp 15). INT/wax-85/15%; was used

is AP bombs. (Ref 2 gives for Filler 101, TNT 92 and Montes was 8%)
Filler No 102: Am nitrate 60, TNT 40% and some was:

uses not indicated

Filler Ma 104. RDX; unes cot indicated

Filler No. 105 (Trialen' 105). RDX 15, TNT 70 . and Al (powder) 15%; was used enst-loaded in GP bombs and torpedoes Another mixture contained TNT 74, auptholene 14 and Al 125

Filler No. 106 (Triples, 106) - RDX 25, TNT 50 and A1 25%; was used in some bombs

Filler No 107 (Triefen 107), RDX 20, TNT 50 and Al 30%; was used in underwater ammunition Filler No 108 (?) (Triselitel). RDX 20, TNT 60 and

Al 20; was used in underwater amountain Filler No. 109 (Trinies 109), RDX 70, Al 25 and Montag wax 5%; was used compressed in pellets, as a biscuit filling with NGu in the nose and as a surround for ; Filler No 106 (Triales 106) in the 500 kg GP, 1800 kg AP bombe and in some prioriess succest missiles,

Note: NGu was used as protection for Filler No 109, which alone is even more sensitive than straight RDX.
Filler Me 110. Am nitrate 90, Al 2.5, napthalene 5 and

wood meal 2.5%; light gray in color; required a secondary HE primer to detonate; was used, press-loaded in concrete and in A/P bombs

Filler No 111, Am attrace 90, carbon 6 and mineral matter 4%; was used press-loaded in some bombs. Note: Ref 3 y 288 given for Filter No 111 Am nitrate 96 and carbon 4%

Filler No 112. Am nitrate 80 and TNT 20%; was use in some bombs ta some pomps #iller No. 113. Am nitrate/TNT/Al powder = 70/20/10;

uses not indicated. Abbreviations: Ai Aluminum; aic sicohol; Am Anmonium

Fillers Used in Anticoncrete and Amer-Placeing Shells. In order to make the explosives such as TNT safe for use in groom piercing and anticoncrete shells.

nose werg made less sensitive to, shock by incorporating some was and K chloride.

A good example of this type of filling was the one in 210 mm Anticoncrete 'Shelf (21 cm GrRe)

its filler consisted of ten pressed pellets placed in cardboard container and held in position by a cement lining. The forward three a cement lining, the toward three sections 6, 7 and 8 were intended to provide protective layers, practically insensitive to shock whereas the layers close, to the base were nearly or just as admirive as straight TNT. The enclosed list gives the compositions and waishes of charges shows on the the enclosed drawing.

No 1: 4 lb. 2 oz of TNT/Vax - 94/6 No la 8 oz of Straight TNT

4 lb. % oz of TNT/Wax = 90/10 1 lb. 5% oz of Straight TNT . 5 1b, 5% oz of TNT/WAR - 90/10

5 lb. 4% oz of TNT/ Wax - 91, 9 4 lb. 2 oz of TNT/ Nam - 91/9

6 ps of TNY/Way/K chloride-60.5/5.4/34.1 5 oz of TNT/Wax/K chloride-44.1/5.6/50.3

No 8 6 oz of K chloride Total weight of filler was 25 th 82 oz

Firing or Ignitor Composition 121. One of the mixtures used during WWE: sulcon 25, Pb chromote 50, and K chlorate 25% [PB Repc 95.613 (1947), Section U].

Finnenhamba. As incendiary bomb containing as oil mirrure/ and a HE busning charge. The following types are described in TM 9-1985-2 (1953), pp 52-54:

a) Flam C 250 A (B or C) contained 50 kg of oil inconducy mixture and TNT burning charge (p 52)

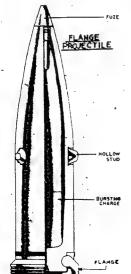

b) Flom KC 750; same filling as above (p 53) c) Flom C 500 contained the incendiary oil consuming:

c) Flam C 500 contained the incendiary oil consulting of 70% percoleum and 30% TNT, with TNT bursting charge (p 54).

(See also incendiary Bombs, Brandbomben and Sprengbombse). (Illustrations are given under Bombs),

Plemenbility Test (Entsündlichkeitsprobe). A special apparatus called "Flammenpendel" and its application to testing of various explosives and proprechnic compositions was described by P.Leass 3 5 27, 36-68 (1932).

Flumenessation of Flume Reduction of Flume Reductio

Floresheeschess (Flange Projectile), called also "Squeeschore", or "Littlejohn"was a subcaliber projectile provided with a flange and three hollow scuds as shown on Figure and described in the TM 9-1987-3, p 360-

It was fired from a cylindrical railed barrel to which a smooth-bored, tapered mazzle extention was attached.

The principal advantage of the "Ihange" projectile in comparison the when subcalabler projectiles was that it was part of the properties was the properties of the part of the decarded, because the bollow settle and the filings were easily depressed when the projectile passed from the rilled section of the gun to the samaller calibes smooth bow extression.

(Compare with Arrowhead Projectile, Arrow or Needle Projectile, Distategrating Band Projectile, Rochling Projectile, Sabot Projectile and Tapered Bore Projectile)

Flow (Lauchtugal low Fachel). A Genom flate usually consusted of a cylindrical cofinators bosting an illuminating element, those being ignized by a pull firties ignizer or since face the flate based by a great containing element. The illuminating element consisted earlier of a ningle or a multiple candle una which wared in intensity of illumination and color. Flates were made with our warshurer.

A brief description of the following flures in given in TM 9-1985-2 (1953), pp 65-81:

3) LC 10 (Levcker) indexach 10) consisted of an aluminum cyfinder, a single candle in a cardboard liner, an "69" clockwork fuse and a parachuse locked in the tast and. The flare was dropped from a plane and at a predaternihed time the luse litted and ejected the candle and in parachuse from the body. Simultaneously the candle was iguard (p 50).

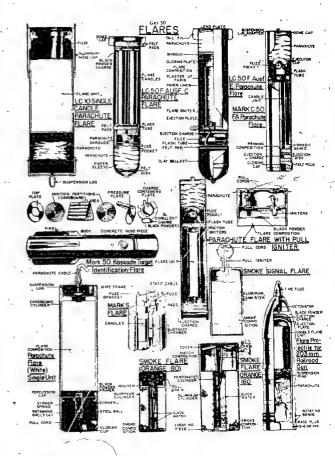

2) FB 30, Sargie Candie Parachuve Flare (p 66)

J C 50F Audi C Parachuve Flare consisted of an aluminum orilindrical body with done-shaped nose anatached by means of brase servers. On telesaing the anatached by means of brase servers. On telesaing the ignited. This fixed the quickmetch, which is turn burned towards the final turn and spiried the black powder charge lights teal. The pressure of the gases developed by the defligacing black powder, caused all four lifest the property of the servers of the servers of the pressure of the pases developed the servers of the se

pull igniedr (p. 81) 163 Germal Flare, Badanlauebes (P) P186 217 is briefly described in BIOS Final Report 1733 (1946), p 2 see the composition of the fluse is given under Pyromechaies. In addition to flusse diopped from planes, there were

nome flores fixed from guan, e.g. the Flate Projectile for the 203 mm Railway Gus (20.3 to Loseltgrosses) described in TM 9-1985-5 (1953), pp 519-20. The she was conventional is design except that it had to ad ditional bourselet machined near the middle of the abs body. The weight of the shell was 2264 lb, that of the flare tandle 'unit' and parachuse assembly 47 lb, and of the expelling charge (black powder) ½ lb. The flare and parachuse were expelled through the base of the shell.

Flesh Reduction in Propollents (Mindungsfauervermindung oder Missiangsfewerdimpfung), in order to reduce the flank produced on combustion of propellants, the Germans for meny years used the salts of potassium, such as K sulfate K pitrate, or K oxelete. The investigation conducted before WW Is has shown that of the inorganic compounds the birst flash reducers bre the alkali salts and that finablessanens is improved on soing up the series in the Percodic System. (Ce is better then Rb and Rb is better then K).

The inormanic flash reducers (such as K sulfers) were usually loaded in small bags separately from the propellant.

and placed between the projectile and the propellane. These anti-flash bean, called in Gorman "Vorlage", consisted of two perforated discs of artificial silk or cores cloth newed together in the form of "doughtern" and filled with coarnely pulverized K sulface. (Ref 1, p 324).

Another flash reducer consisted of a large bag with avalle acid and a small beg with pornssium oxalate.

. With the incorporation during WWE of ninomanidine (NGu) in some propullants (now Gudelpulver), it was found that NGs alone gave sufficient flashlessess without incorporating any of the usual fleak reducing agence, he propellants, which did not contain NGs, flashlessesses could be successfully achieved by using a small bag with

NGu and a small bag with K nitrate.
It should be noted than the use of inset (mon-explosive and non-combustible) flanh reducers such as K sulfato. sitrate; or exalare, sunlic, sold etc, is always bound to decrease the ballistic potential of the propullant ned their use in large amounts should be avoided. This does not apply to NGs because this compound in not have but is MGs may be used, either directly incorporated in a powder."

or used in a separate bear The following German flush reductants were manifed

Picuriney, Arsensi (Ref 3) ducing WV E: a) Potassium chincide; was used in 76.2 mm AP weape h) Potentium sulfate; was used in 7.92 Bell, :20 me APHY, 20 me inc. 20 mm HE binner, 30 mm Salach 37 mm APHY, 37 mm APHY, 37 mm APMB, 37 mm NE. 50 mm HE; 75 mm AP; 75 mm HE and 100 mm K18

Farmit (Formite). One of the Ersensprengutoffs developed during WWE by an explosive group under the direction of Dr. Hone Walter, It was obtained by heating a mintage of 30% commercial formaldehyde and NH NO (in the ratio 6 mois HCHO to 8 mole NH NO ) under reliating about 1 hour, followed by wacaum distillation to remove the water and careacted formaldehyde. The residue was a faintly yellow composition which consisted of MAN Sala 25 to 30, TRI-Sain 1 to 3 and Am mitrate 67 to 74%. Ica calorific value was 900 kcal/kg and volume of gasts pro-duced on emplosion 1050 l/kg (calculated at 0° and 760 mm Hal. When about 15% of RDX for PETN was incorporated. the velocity of detonation was increased appreciably and the brisance was increased to that of TNT, while the volume of sases evolved on explosion was higher than for TNT. This explosive could be cass-loaded sesting point about 90"1 in projectiles but un fortunately is exuded at, 60-70 le was fauly stable to heat, provided no iron imputities Were Devent.

Fp. 88 '(Füllpulver B8). Explosive, pattern 1888 (P. A.).

Fraumont Density Test, Fragment Concentration Test or Density of Splinters Test (Splitterdichteprobe). A series of investigations were conducted during WWE by the German Ordnance Dept (Vaffenant), under the direction of De G. Romer in order to determine the relation between effective. tragment (splinter) weight, fragment velocity, fragment number and fragment range (distance of travel) and the weight and type of the explosive material; as well as the type and thickness of steel used in ammunition. These costs were conducted with a view to designing the most effective ammunition. One of the tests used for this purpose was the fragment density test (density of fragment test), which was conducted in the following manner:

A shell containing an explosive to be tested was detonated while susrounded with wooden boards 2,cm thick. The number of fragments per square meter piercing the boards was counted and the average distance at which there would be one fragment per: so m was calculated from a apecially constructed curve. In order to obrain reliable results it was necessary to decesse at least

Following are some values for the average diseases to obtain one penetration but square meter using a 105 mm shellt .

TNT 39-40 m, 40/60 - Amatol 38-39 m, 50/50 - Amatol 35 m. 60/40 - Ametol 34 m. 50/50 - TNT/NeCl 26 m and 40/60 - TNT/NaCl 25 m.

Note: As this method was expensive and time consuming. the Krimmel Factory of Dynamic A-G proposed loading an iron tube with an explosive to be tested and to detonate it on lead. No details of the last method were given,

11 O. W. Srickland et al. General Summary of Explosive Plants. PB Rept No 925 (1945), Appendix 7 2) G.Römer, PBL Rept #5 160 (1946) and private communication Dec 12, 1953.

Friction Type Jeniter (Brenn zünder), See under leniter.

Friedler of Halberstadt in 1893 parented an incendiary composition which burst into fisme on contact with water It consisted of metallic sodium or potassium incorporated in a mass of crude rubber. The mixture was loaded in thin walled projectiles which being lighter than water floated on its surface ( Daniel Dictionnaire (1902), p 310 ).

Fritsche Zündschner (Fritsche's Fuse), A core consisting of a pressed mixture of K nitrate 63, alderwood charcoal, (Establishments) 13, and pulverized sulfur 24% enclosedin a fabric tube. It was slow-burning, [A.Stut-bacher, Speeng- und Schassatoffe, Zürich (1948), p. 107],

F-Seeff (Timmlum Terrachloride). Sor gannel section; wan Berlin (1936), pp 161-66ened as a smoon-producing agent.

"Punt Dil fgettene (Dienel Ignitern) were sticks of road 4" x 14" x 140" which were dipped, first in occome-callulate solution and then in the following pyrotochate mixture: Al .30.6, Be nitrate 26.3, . K nitrate 23.0, S 5.0 and gam 6.9%. In order to make the match friction sensitive, one and of the stick was coated by disping it into a mixture coarnining K chlorete 66.9, Fe maide 14.9, pawdated sless 6.0 and gum 12.2%.

"glans' 6.0 and gem 12.2%. Og" satisfies, there igniters, bassed florenly, it is believed that they were used for igniting fuel all in power Reference: T.M.Bennett, BIOS Finel Rent, 1313 (1947), ...

Fillouivir (Fp) adm Filling (Filler or Filling Explosive). San Filler

Palinuffe (Filling Micerials). Non-emplosive majorials, restreeme triting perceising read-unpersive motorities and such as NaCl, chalk, etc., incorporated in dynamics and mathematically companition, either, to, change, she character-igion of explosives (such as to make them less brimes) on to occasable on the amount of NG, TNT, etc.

Dynamies containing Fillesoffe were called Se-strainte Dynamite (Stretched dynamics) [Noom, Schicesand Seemanteffe (1927), p 100,

Fulnanit "(Fulnenite). Fulnenites were Faviar-true exphonium such ant a) An airmay \$6.5, perceives 4, TMT 5.5, perceive ail 2.5 and charces 1.5% (Ref 1), b) Am airmay \$2.5, guaratten 4, THT 11, charged 1.3, and parallis all 1% (Bef 2): References:

Fulnismen Scott (Falminating Compound Under this name, Southacher, Sprong und Schiesoueffe (1948), 10-114. lists the following subsumces: Jedstickscoff, (Microgen indice), Kanilaither van Berreller (Fulmisseing nilver of Bestelles), Natrodianebenselperchlerat (Nitrodianebenneneperchisente) and Knulleilber (Silver falminate).

. The initiating compounds, such as MF, LA, and L St . ace lined in the name book sh Zundstoffe.

Fulminatio As explosive proposed by Fuchs of Silesia: NG 58, and wool shearings (clippings) 32% [ L.Gody, Truité des Matières Explosives, Namer (1907), p 359 7.

Pointnetrebour Fulminate Fare) is a demonstra fuse which has a odre of mercuric fulminary descentified with paraffin Its velocity of deconation is 5300 m/sec. [ A.Stexbacher, Spreag and Schiesstoffe, Zurich (1948), p 107 ].

Funkanahranagruph (Spark Chronograph). See Chronographs in the peneral section.

Punkensinder | Spork Inniter or Primer (Electric) Devices ? such as Bornhaudt's are described in Benling-Drakopf (1930. p 216.

Furtural Aluskul was used to initiate the combustion o gasoline at the moment of its coming in contact with mixed auxic-aulfuric acid; called SV-Stoff in Germany (CROS 30-115, r il).

Fuse (Ziladechner oder Zeitzflader). See genemi section and also Beyling-Drekopl, Sprengutoffe und Zündmittel,

Punt (Ohnolete), Daniel, Dictionnaire des Macières Enplonives (1902) described a fuse called "mache allomande (German fune). It consisted of a surip of paper improgramed with sulfur and saltparer, then dried and incented in a paper tube containing a small amount of flag grain black powder. The enzembre was placed in a bere-hole, in the of a carriage of a blusting explosive. After igniting the atrin of paper, the operator took cover.

Fung. Salety (Sicherheitsnundschutt). See under Fusen in the preem nection.

Fundamed in the combination of bridge wire, innited bond (drap) and lead-in wiren, le is a companent of elecuic primers and detenators [ BIOS . Final Rept 833, Item 2. » A3/27 ]

Note: In ClOS Report 24-3, p 7 the seest combination is called "Electric Match Head".

Fundand "A4" Low-consist fundand introduced during WI as a subscitute for basebend 63" after it became difficult to obtain the cerium-magnetism metals accessary for the preparation of Mirchmentil (mixed most) and of the general ingredients of "GS".

The" A6" were prepd at Trainder! Fabrik by dipping the sin of a bridge wire (called also fuse) successively lase) the following liquid compositions:

a) lat die which consisted of day Ph picross 90g and nilicon (20 to.-60 micross) 10g, all suspended in about 75 ml of a 2% solution of NC in anyl or buryl ocease. The conting was then deted

b) 2nd dip which consisted of dry Ph-picrate 50n. Ph chromate 35g and silice (20 to 40 micross) 15g, ali purposeded in about 75 mired 3% solution of HC in appl or busyl accence. The coating was uguin dried

c) Ard din which was it located consisting of a 15% solution of NC in 75/23 butyl accents/ethanel, to which was added (20% day weight of NC) Signific AOM, which in the methyleveloheryl actor of adjaic acid -

d) 4th dip was the same as the 3rd, but it contain C.Rr of Sudan Brown per such 101 of lecquer.

Note: Soldering of fuse wires to-lead-in wires, proparation of the dry ingredients for functionals dies, preparation of NC Incures and the process of dipping the function combe are described under Funcheed Manufacture. Reference: BIOS Final Report \$33, Item 2 (1946), p A3/35.

Payahand Comb A new type of fusehead suitible for machanical production was developed during WWR at Traindoct. Ir consisted of a strip of sheet steel from which the oneline of a comb was stamped. The two legs of each fusehead were then bonded together with Mippinn, the tips of the touth animably bear and the bridge wire soldered into posttion. After divolag the bridge wires has fusehead compositions, the back of the comb was absenced off [ 8105 Final Report No \$35, form 2, London, (1946), n A3/363.

Fundamed "G 3", Now tention functionals used in matern delay detonators were prepared at Traindorf Fabrile by distains the tip of the "bridge wire" (feee) successively

in the following liquid compositions:

a) Let dip which consisted of 77g dry lead-picture
18.5g cerius—negoesium—mixture (Mischmetnil) and . 4.5g siderwood charcoal, all suspended in about 75 ml of a 2% solu of NC in ampl, or buryl accesses. The comthe was dried

b) 2nd dip, which contained 43.7g lead picrove, 25g, aluminum (prepd by crushing Al foil to a particle size of 10 to 20 microns), 25g cerium-magnesium and 6.25g alderwood, all suspended in 75ml or a 3% sols of NC influent, or butyl accrate

c) 3rd dip which was a lacquer consisting of a 15% volution of NC in butyl acetate/athanol-75/25, to which was added (20% of the dry weight of NC) Sipalin AOM. , which is the methylcyclohexyl ester of adipic acid. This lacquer was fairly impermeable to mointure and cracked less readily than straight NC lacquers.

d) 4th die which consisted of the 3rd die to which was added 0.8g of Sudan Brown dye for each 10 | of lacquer). Europeada made with G3', composition developed heat amounting to 580 cal/g, the pressure developed by 1g was 880 acm and the volume of gases 190 cm3 per g at NTP The disadvantage of G3 was its bygrosopicity which made it quetable la storage. . Fundand Manufacture. The bridge wire ("fuse") mide from an alloy 80/20-Ni/Ce, (or 60/15/17/7/1-Ni/Ce/Fe/Mo/Mn) was soldered to two lead-in wires (made of soft from 0.60 mm in diameter) by means of a 60/40-Sa/Ph solder and Za chloride flux. The wires were coated with a 0.25 mm layer of Mipolam. Without cleaning the flux from solder, the tip of the fusehead (heidre wire) was divord into an ignited composition, such as fusebead composition A6, fusebead composition G3, Spale, or Marspille. Each fuschend required four dips which were conducted as follows:

A number of funcheed assemblies were inserted in a special frame placed over a pan containing an appropriate dip mixture, and the frame lowered until the tips of the fuseheads were immersed in the liquid (dip). Then the frame was removed from the dip; turned upside down and slowly moved (with the fuseheads uppermost) through a semi-circle for 15-30 seconds. After thin, the frame was hung by the handles from cleate affixed to endless chains leading to drying tunnels The tunnels were about 50 feet long and were heated by steam from below the bottom platen. The 2nd, 3rd and the dips were conducted in the same manner as the lat out. After being dipped and dried, the fuscheads were graded for remistance, using a special automatic was 1.0 to 2.4 ohms and they were kraded in ten steps; 1.0 to 1.2, 1.2 to 1.4 ...... 2.2 to 2.4. For high tension funchends (nuch as "Spalt"), the usual resistance tunne was 3,000 to 15,000 ohms but the upper limit was not specified because it was found that fundingeds of 100,000 ohms, or even more, functioned satisfactorily.

a) Preparation of dry ingredients for funchead dips. The dry ingredients for fusebead dips, with the exception of Mischmetall, were usually mixed behind a barricade in a graphited, papier muché drum, 6" diameter and 10" lone. provided with an aluminum lid. The drum was rotated at

14 spin, Six No 6 soft rubber stoppers were placed insidthe draw to aid mixing.

The Mischmetall was considered to be too inflammable to min in the dry sence with the other ingredients and was always added separetely after the other ingredients had been sided to the NC varnishes. (The Mischmetally was previously pulverized by grinding it under sylol in a small ball mill. Then the zylol was decauted and the alutry was transferred to filter paper on a funnel, where it was

washed with bearene, spread on trays and dried :

b) Preparation of NC varnishes for Inscheads, Before 1943, amyl accente was used as the solvent but when it became unavailable, butyl scelate had to be used aithough the workers objected to it because it affected their breathing even more than amyl acetare

Two grades of NC were used for the preparation of funcheads E 620 and E 1160 (N content was not given) and both of them were received at the fusebead factory wet with about 30% ethanol

The preparation of the watnish consisted in a thorough blending of the alcoholic NC with the desired amount of of butyl acctate in an iron drum provided with a wooden naddte stirrer

c)"Mixing of the dry ingredients with NC varnish, A slightly smaller amount of NC varnish than required by the formulation was measured into an 8" diameter "Pollopas" plastic bowl. and the dry ingredients were alonly added while continuelly stirring with a wooden spatule. Any Mischmetall required was then stirred together with the remainder of the NC varnish. The dip was thoroughly mixed by hand, using a wooden sparula, for at least one-half hour. The viscosity of the dip was then measured and if it wall too high, it

was reduced by adding small quantities of buyl scorace. 1) R.Ashcroft et al. Investigation of German Commercial Explosives Industry , BIOS Final Report No 855, StampNo 2, London, H M Stationery Office (1946), Appendix A5, p.27 2) Anon, Manufacture of German Deconators and Deconating Compositions, PB Rept. No 95,613 (1947), Section D.

FUZE (Zünder) German junes may be subdivided into Bomb Fuxes and Projectile Fuxes. The first group was used in agrial bombs, some booby traps and in some pyrotechnic devices and the second group is shells and A. Bone Fuze (Bombenzinder). The Germans employed

both mechanical and electrical bomb fuxes. The mechanical types were used in smaller bombe (such as 2 kg, 12/kg and 50 kg) and in some hooby traps, whereas the electrical fuzes (developed and manufactured by the Rheinmetall-Bornic Co) were used in all kinds of HE bombs and in flares. Among the electrical fases was the "proximity fuse", type 6 used in incendiary bombs C 250 Fism and According to Ref 1 there were ten basic types

Mechanical Impact and flare fuzzes; used in Z ka

Butterfly bombs and 2 & 4 candle flares-

No second Mechanical impact fuze; used in 12 kg A/P bomb

Mechanical impact fuze; used in SC 2500 bomb Impact fixe: instantaneous of short delay; (lamitarets): used in HE (SC of SD) bombs Proximity fuxe; used in C 250 and C 500 Flam Sombe

Long delay time bomb fuze; used in HE bombs impact fuzz (sea targets) with slight delay to effect detonation at some depth below the surface used in HE (SC or SD) bombs

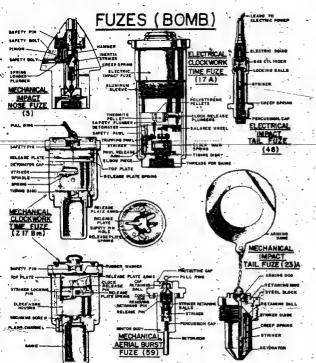

9 Aerial burst (short rime) luxe, used in parachute flares and photoflash bombs 10 "Protective luze; used in hooby traps and SC 250

& 500 ke bombs. Fach of the above heart types extered in one or several ariations. The following chart, based on the information obtained from Refs 2 and 4, lists these variations ac-

cording to their numerical designations:

1) Mech Imp Nose Fs (3) AZC 10 (Hot;\*, Type 3 used in SC 12 kg A/P bomb (Ref 4, p 134)

2) (5) Elec Fuze was forerunner of Type ) fuses, but is now obsolete. The A variety was manufed in Spain (Ref 1,

File No 2321.5)

3) Elec Short Time Assial Burst Fz ElZtZ (9) or (9)\*
used in paracture flares and photoflash and gas bombs
(Ref 4, p 167)

4) Elec Imp Fz ElAZ (25), or ElAZ C 50 (15) (obsolete) was used in SC 50 to 2500 kg, SD 50 to 1400 kg and SBs 50 kg bombs (Ref Z, file 2321.5 and Ref 4, p 139)

5) Elec Mach Long Delay Time Fx ElAZ (17) Time 2

30 Elec Mech Long Delay Time Fs ElAZ (17), Type 7, used in SC 250 and 500 kg bombs having two pockets (Ref 4, p. 352)

for Elec Mech Time Fz EfAz: (17) A, ElAZ (17) A\*, ElAZ (17) B\* unced in the mass-bombs as ElAZ (17) Res-4, p. 204;

7) Mech Time Fz Z 17 Bm used in SC 500 & 1000 kg,

PC 1000 kg sad 858 1000 kg bombs and Hz 293 flying
bomb (Ref 4, 155)

B) Mech Imp Tail Fz (23)A weed in Brand 10 kg, NB 2 kg and SG 3 kg bombs, as well as in single unit parachute flares (Ref 4, p 134)

9) Mech lmp and Actibreak-up Fz (24) and (24fA used in the forward pocket of SC 2500 bomb (Ref 4, pp 135-8) (See a brief description under Antibreak-up Fuzes)

(See a brief description under Antibreak-up Fuzes)

10) Elec lusp Fu ElAC (25), (25) A, (25) A\* & (25) A\*\*
used in HE bombs (Ref 4, p 140)

11) Elec lusp Fu ElAC (25) B, 25 B, (25) C & (25) D used

11) Elec lesp Fx ElAZ (25) B, 25 B, (25) C & (25) D used in SC 50 to 500 kg and some far bombs (Ref 4, pp 141-2) 12) Elec Proximity on Imp Fx, Special ElAZ (26) used in Inc bomb KC 250 "Flam" (Ref 4, p 144)

13) Elec imp Fs EIAZ (28)A used in HE bombs SC 50 to 2300 kg and Inc bomb C 250 (Ref 4, p 165)

60 2700 kg and inc bemb C 270 (Kel 4, p 165) 14). Elec Imp Fs EIAZ 28 (\*) or EIAZ C 50 28 (\*) used is HE bombs (Ref 4, p 162)

15) Elec Imp Fa ELAZ. (28) B used in SC bombs against see targets (Ref 4, p 163) 16) Elec Imp Fa ELAZ. (28) B<sup>R</sup>, (28) B<sup>R</sup> & (28) B<sup>0.7</sup> used in HE bombs (Ref 4, pp 163-4).

17) Nech Actial Burst Fz (29) used in LC 10f parachute flore (Ref 4, p 168)

 Elec Imp Fs EIAZ (35) used in HE and AP hombe (Ref 4, p 142)

19) Elec Imp Fz ElAZ (38), (38umg) & (38u) used in HE bombs (Ref 4, pp 167-6) 20) Elec Imp Fz ElAZ (38 4) used in SC 250 kg bombs when employed as depth charges against U-boats (Ref 4, - 166)

21) Elec Imp Fz ElAZ (38)B & (38)C used in FX (400 and HE boshe (Ref 4, pp 166-7)
22) Mech. Annivibidaysmell Device ZuzZ 40, Types I, II & III used in SC 250 & 300 kg bombs under (uzes (17), C17)A ovi(17)B (Ref. 4, pp 137-81)Xes a brief description

(17) A or (17) B (Ref. 4, pp 1,77-B1)(See a brief description under Antiwithdrawal Fuzzes)
23) Mach Imp Fz AZ 41 or 34-41 used in SD 2A "Butterfily" bomb (Ref. 4, p 1,32)

24) Mec Imp or Aerial Burnt Fz "AZ (41) A cot" was used in SD 2B "Burterfly" bomb (Ref 4, p 132)
25) Elec Imp Fz ElAZ (45); uses are unknown (Ref 4, p 142)

p 142)
26) Elec Imp Fz ELAZ (45) A used in SC 50 bombs (Ref 4, p 142)

Electrically Armed Mech Imp Tail Fr AZ (46) used in KC 50 gas bombs (Ref 4, p 145)
 Rocket Bomb Fr Assemblies (49) A & (49) B, Type 9

20) Rocket Bomb Fx Assembly (49)A & (49)A, 1976 y used in PC 500RS, 1000RS bombs and 1800 kg "Erdstuka" (Ref 2, file 2324.92 & 4, p 169)
29) Rocket Bomb, Fx Assembly (49)C used in PC 1800RS

(Ref 4, p 170)
30) Elec Assidisaurbance Fz 50 and (50) used in SC. 250 and 300 kg bomba in conjunction with fuzes (17), (17) A or (17) B (Ref 4, pp 481-3)
31) Elec Antidisaurbance Fz 30b q "Y" (See under Anti-

31) Elec Antidisturbance Fz 50b og "Y" (See under Antidisturbance Fuxes) weed in HE bombs alone, or in conjunction with other Rheinmetall fuxes (Ref 4, p. 184) 32) Elec Imp Fz ElAZ C50 (5) (obsolute) & C/50 (15) used in HE bombs (Ref 4, p. 189)

33) Elec Imp I-z ElAZ (55)(tp), (55)A/M & (55)A\* tend in SL & SB and other bombs requiring instantaneous

m action (Rat 4, pp .43-4)

34) Eleg Chemical Time Fx ElAZ, (57) used in "Staba" bumbs (Ref 4, p 1)7",
35) Mech Aerist Build Fx (59) used in single & four

candle parachute flares and BIC, 50 photoffash bombs (Ref 4, p. 1-1).

30) Elec Aerial Burst 1 z 59A h 459) A used in A/P and inc continuers (Ref 4, p. 172).

37) Elec Aerial Burst Fz (59)B used in some HE bombs and parachute flares (Ref 4, p'172)
38) Mech Aerial Burst Fz Z 60 used in supply dropping

containers (Ref 4, p 186)

39) Special Imp Fz Z66 used in SD 10A bomb (Ref 4, p 146)

40) Mech Time Fz AZ (67) Zeit used in SD, 2B "Butterfly"

bomb. It was locked centrally in the upper longitudinal surface of the bomb (Ric 4, p 159) 41) Mech Time Fx 67/V used in Mk Ab 7: container to ignite 2 of the 5 candle units housed in the Novamer (Ric 4, p 160)

42) Elec Actial Burer Fs. Pyrotechnic Delay 69C ff. 69D & 69E (Ref 4, p. 173) used in AB 36, 250, 400 & 100 and BDC in comminers 43) Chem Mech Long Delay and Antidisturbance Fs.

43) Chem Mech Long Delay and Antidisturbance Fs (70) A used in SD 2B bomb (Ref 4, p 187) 44) Mech Antidisturbance Fs (70) B & (70) B/1 maed in SD 2B bomb (Ref 4, p 187) 45) Modified Mech Antidisturbance Fs (70) B umg used

45 Modified, Mech Antidisturbance Fz (70) B umg used in aircraft rowed paravana bomb (Ref 4, p. 188) 46) Elea Aeria Burst Fz, Pyrotechnic Delay ElZzZ 73, (79) & (79) A ward in parachute flares, SC 250 & 500 bombs. AP & lac containers and boxofilash bomb

(Ref 4, p 174)
47) Mech Imp"All-Veys" Action Fz. VZ (80) used in Ha 293
flying bomb (Ref 4, p 189)

19) Ditto VZ (60) A used in V-1 flying bomb (Ref 4, p. 190) of 49) Mech Avrial Burn Fs Z (89) used in phonoliash hoseb, pain-thur Blazes and some containers (Ref 4, p. 179) 59) Ditto Z (89)B, (89)C & (89)D used in some containers (Ref 4, p. 175)

(Ret 4, p 1/7)
51) Elec Imp Fz ElAZ (106)\* used in Flying Bomb\*Penneminder iS\* (Ref 4, p 149)
52) \*\*Dust Fuze\*\* used in SD 10 bombs (Ref 4, p 191)

Vistav, Bomb Fuze, El AZ 35A)
(See also Aprill Burst, Antidisturbance and Klectric Fuses)

B. Prajectile Fuse (Greekosszinder) existed even in a greater warsty than bomb fuses. The former may be subdivided into Point Detonsting (PDIs) and Base Detonsting (BDF) types. A birtif description of typical

German projectife fuxes is given by Englesburg (Ref 2).

The following types are listed and briefly described in Refs 3 and 5.

in Refs 3 and 5.

I. Point Octonoling Fuxe

1. Imp Fx AZ 1 used in 75 mm and larger caliber shells

(Ref 5, p 584)
2. Imp Fx AZ 2 uses not indicated (Ref 5, p 588),
3. Perc Fx AZ 23 Sacion were the most important and

wied throughout for Grenne Artillery Ammunition, mostly for 72 metallic for the first state of the first sta

a) Perc Fx (with delay 0.15 and 0.25 and 1.5 and 0.75 and

b) Perc Fa AZ 23Geb used in the 75 mm blountain Gnm (Ref 5, p 576) c) Perc Fm plastic body AZ 23V(0.15)(Pr) and AZ

23V(0.25 XPr); uses not indicated (Ref 3, p 353) d) Perc Fx plastic body AZ 23Nb(Pr) used in 150 mm. Smoke shelts (Ref 5, 607)

a) Perc Fz zinc body AZ 23V(0.73X2a) and AZ 13V (0.23)(2a); uses not indicated (Ref 5, p 573) f) Modified Perc Fz AZ 23ung used in 75 mm and

105 mm HE shells (Ref 5, p 575) g) Perc Fs AZ 23/28 used in 88 mm HE AA shells (Ref 3, p 349)

h) Perc Fx (delay 0.15 sec) AZ 23/42 V(0.15); uses - mrt indicated (Ref 5. p 573)

i) Perc Fu (modified) 1 jg.Z. 23AA used ins 75 mm Light Infentry guin Another model of 1 jg.Z. 23AA was used in 2 10 mm Rocket 42 (21 cm Wgr 42 5pt) (Ref 5, p. 583) j) Parc Fu and Perc Fu (delay 0.4 sec) sjg.Z. 23 mad 13V(0.4); uses not indirected (Ref 3, p. 946 6, 5. p. 573 k) Perc Fu sjg.Z. 23Nb (algsZ. 23Nb) used in Smoke shells (Ref 3, p. 575).

Note: Other less important, versions of fuse 23 included; AZ 23 (obsolete), h.z. 23 (0.2) and AZ 23 (0.2) (ung) (Ref 5, pp 573-4) 4) Small Perc Fz "klaZ 23 Series existed in the following

wariations:
a) Perc Fu (amall) klAZ ,23 used in .75 mm HE and 75 mm k 105 mm Smoke 4 mls (Ref 5, p 576)
b) Perc Fu klAZ 23Mb used in Smoke shella (Ref 5,

p 578)
c) Perc Fz with delay 0.2 sec, modified klAZ 23V
(0.2Xumg) used to 75 mm A/T Guas 40, 42, 76.2 mm
Russian A/T Gun 36 and Field Gun 39 (Raf 5, p 574)

Note: Other, less importunt, reasilence of meal fuse 23 included that 237(0.2), k1,22 23/1, k1,42 237(0.2), (Pt) and MAZ 23N(Pt) (Ref.), pp 578 2578)

3) imiterous DA and Gazze Type Fz (with a combined)

graze and DA mechanism) AZ 35K used in 170 mm AE Shell (Ref. 5, p 5007 6) Mech lusp Fz AZ 38 used in HoC projection (Refs. 3, p 353 & 5, p 568)

71 Detonating imp Type Fs (with DA mechanism) AZ 39 used in 50 mm HE shell (Refs 3, p 317 & 5, p 569)

8) Pere Fr klaZ 40Nb & 40Nb(Pr) used in Smoke projectiles (Ref 5, p 5"9)

9) Perc Fr AZ 47 & AZ 48, similar 1a construction to AZ 19, were used to 20 am Ammo (Ref 5, p. 571) 10) Perc Fr AZ 49 used in 20 am Shell (Ref 5, p. 571) 11) DA Jusy Fr AZ 150 & 100 RbS used in 20 am Shell

(Ref 2, p 315 & 5, p 564)

gue or howsteer shell

fuze

Time fute Note: The letters No following the fuze aumber signify smoke shells; the letters ZerlP signify the presence of a guapowder peller which is destroyed on firing to release a centrifugal firing device. Fuzes with a setting device for optional delay are stamped with the letters "m", "Y", "o" to indicate the position to which the slot in the setting. plug must be set to cause either delay or non-delay. The "d" examping indicates the setting position for "fithout delay", the "Y" stamping, followed by numerals such as

V(0.25), indicates delly and the figures, the period of

delay. The letters "o V", stamped together, signify "ohne

Verzögerung" (without selay), while "mv" signify

" Verzögwrung" (with delay). Other German abbreviations are great at the

Gasdruckpotrenen (Gas Pressure Cartridges). See general section and sino the article entitled "Die Entwicklung der Gasdrucknatrosen in Deutschland' by E.R. von Hers in Explosiveroffe. 1954, Nefe 5/6, pp 64-8.

Gaseous Matel Treetened, such as thrometizing of item or steel articles by the diffusion of chromous chloride rapper it high temperature is briefly described in BIOS. Einsl Repus 839 (1946) and 1534 (1946).

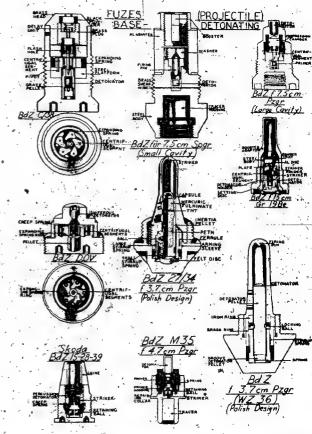

Sasless Delay Derematers (Electric). German moless delay desonators, of WE were usually proposed no follows: "Al or Cu decourse shells (Hilling) having an outside diameter of 7.20 mes (for Al) and a length ranging from 52.5 to 85 am (depending on the delay required) were thoroughly cleaned and dried before londing.

"Terryl was loaded first in two increments, a total of 0.7g, to serve as a base charge; this was followed by an initiating charge of 0.3g of 60/40 L A /L St. mixtureand a perforated (reinforcing) cap all pressed at 250 kg/cm2.

Note: Tetryl, as well as L A. and L St , were previously dried to a maximum mointure content of 0.1%.

After keeping the loaded detonators for 3 days at 30 in order to remove all traces of moisture, 50 mg of loose intermediate composition was placed on top of the reinforcing cap: .

Note: The intermediate componition (powdered mixture of Sb and KMnO ) forms a loose connection between the delay composition (to be loaded next) and the mutiating composition. (L. A /L St.). The intermediate composition, burns with a strong flame which facilitates the ignition of LA /L Sc mixture. Mixtures are possible if the delay mixture is placed in direct contact with L A/L St (Cont'd on p 65):

sections composition the delay stament conty a com- arrante of explosion 2485, volume of gages at NTP 264.4 seemed pulveruling mixture of 55 and Riday. The '1/kg, specific peasance 3733 and dermanter shell was then crimped just above the upper References P. Naoun, Nitroglyceria (1928), pp 378 and 361 and of the delay always in order to provide a neat for the Mippless stelling plug.

According to CIOS Rest 24-3, pp 5-6, the gasless of these permissible explosives are described by Nacon. powder (also called 'gasless delay fuse powder ) ted of about 70% Sb powder and 30% K germanganate for alow burning, or about 46% \$6 and 54% & permangunare for face burning. The purpose must was ground in a disc ree tase, manne, jue purmapunare was ground in eine or plane dismeter milt to appreciancely 30 meah. The Sb was ground; from lumps in a vibratory ball mill and the powder was transferred by a nerew freed into an air separator. The finer which did not exceed 10 microns in size were The fines which did not exceed 10 microns in any were collected and blender with the permangange by means of a tambing mill. The resulting matter was compressed than the pablests were formed to give more infinite collections. The collection was the ingrediently. The shelter were the horse down at all and the resulting powder used for filling deconstore.

The inches engently (see Fuschesd Manufacture) cos sisting of bridge wire, igniter bend, two lead-in wires (insulated by Mipolam) and the Mipolam plug was inseried in the decourer shell in such a manner that the plug rested on the shoulder of the detounter shell formed by crimping. A second crimping was then made above the alug and the lead-in wires were connected to a senter of electricity when the deteaper twee or he fired, 1 Referencest

Colorino-Astrolit (Gelecin-Astrolite). A plastic low-freezing explosive based on dinitrochlorohydrin (DNCH). Several ensieties existed, of which the composition manufactured before WWE by the Dynamit A .- G was widely used in shaft sinking by the freezing process and also in other rock work where low-freezing dynamics is desired during the colder parts of the year, such as in building water power plants. it had approximately the following composition and prop-enties: geletinized dinitrochlorohydris (DNCH), including NG 30, mixture of DNT and TNT 10, and Am and Na nitrate with wood meal 60%; Trauxi tent value 400cc, Pb block crashing 18.0 mm, sensitiveness to initiation required at least a No 3 cap, propagation (gap) using two 25 mm curtridges 20.0 mm, velocity of detonation 7300 m/acc, heat of explosion 1127.5 Ecal/kg, temperature of explosion 2534".

dennity 1.45. The gelatist-Astralit which was permitted to be transported on German railfoods was required to contain aclasinized disitroglycol 30, aromatic disitrocompounds 8, asomatic trimirocompounds 4. Am nitrate and vegetable meal 58%. for properties were: Trauzi value 415 cc. Pb block crashing 19.0 mm, sensitiviness to initiation required at least No 1 cap, propagation (gap) (using two 25 mm carmidate 50.0 mm/ velocity of detonation about 6500 m/sec

at a density of 1,45, heat of explosion 1158 heal/ke, tem

Galutina-Donarit (Galatin-Donarite). A type of gelatinos industrial explosive commissing about 50% of As sitrate, 30% of mixture of diagrochlorohydrin with mirroglycol and 20% of other lagredients, Its properties are: temp of unplonion 3225° C, vol of gases at NTP 803 1/kg, carridge density 1,45, specific pressure 10100 kg/cm2, veloc of deton 6250 m/sec, Traus! test 380 'cc and impact sensitivity with 2 kg weight 20 cm. (See also Donnett Gelatin Type, Sunder Donnett) .

Reference: F. Weichhelt, Sprengorchaik, C. Marheid, Haile/ Saale (1953), pp 37 & 375.

Geletice-Dynamic (Gelarie Dynamice) - the first gelatinous NG explosive. It was proped by A.Nobel in 1875 (See Swedish Section). The current pelatin-dynamites consist of 10 to 65% of a liquid nitrie auger tauch as NG mined with a small amount of collodies corton and 80 to 35% of "Zumisch-

sulver", "called in the U S A "dope" . .. They may be subdivided into the following typen:

A) Gewillelichen und schwerzefnurbaren. Ordinary and difficultly freezing (low freezing)

B)' Phlugmatinierers, transportuickeren - Phlugmatized, unfe C Schlaguetteres: Sale in the presence of firedamp (per-

missible dynamicos).

To the A type of dynamics; belong the blusting geletin and the dynamics shown in Table 19 with the exception of those which commis only a small amount of NG. Any of these emplecises may be readered low-freezing by incorpereting nimegly cel, dinimegly ceris, dinimechloshydeln, our

The following composition, Linted by Stembacher (Ref 4, p 83), may be given as an example of the "schwebterfrierbares" dynamite : RG with nitroglycol 62.5, collect cotton 2.5, Na ot X-nitrats and/or K perchlorate 27.0, and wood mint or tye ment \$,0% with prepared chalk (Schillmenkreide) added 0.5%.

To 198 S group belong dynamics in which part of the NG is replaced by distirochlochydrin .

Note: Aromatic nitrocompounds have been used in countries to replace pare of the NG.

To the C group belong explosives containing small amounts of MG and appreciable amounts of cuoting agence . such as alkala chloriden. Dynamicon which commin insper mace of ammonium nitrare (see Ammongelation) alon baloon to the permissible group.

Table 19 which follows gives composition and

properties of typical geletic-dynamics

Glide Somb (Gleichoube) in a atreamlined missile provided with wings and stabilizers to allow it to glide towards a carnet in free flight, after it is released from a place flying in approximetely begineated position:

The houth in used to actack targets at a greater horizoncal distance from the releasing plane than would be stracked

by normal bombs. \ This method of bombing is designed in order to keep the releasing plane out of the cappe of cases; AA-

A short description of principles of a glide bomb may.

be found in the following papers E.W.Spender, "Unternuchung der Seitenntabilität einer Gleitbombe mit einen automatischen Steuerung obne Vereilung". Zentrale: file "Wissenschaftliches Berichtwenen der Luftfahrtforschung des Generalluftzeugmeinters 3 (ZWB), Berlin-Aldershof. Forachungabericht Nr. 1919, May (1943) (Included are 12 references). Notes English exactation is available as Technical Memaccording 1248 of the National Advisory Committee ... her Aeronnutice August 1950.

Glycum Glycetlal See amoral section.

Note: According to M.L. Sheely: "Synthetic Glycetin", BIOS. Mincellaneous Report No 24, (1948), the Ludwigshafes Plant of the 1G Farbenindustrie annulactured synthetic alveerin during WW II by the "Five Stage Method", starting . from propanol, chlorine, Na carbonate and Na hydroxide.

A colorless, viscous, glycerin-like liquid consisting of about 35% glycols, 35% glycens, 25-28% henitel, environ and other compounds. It can be preed by continuous entalytic hydrogenelysis of sugar at 200 and 325 atmospheres. The detailed phocess, operated commercially at the Höchst Plant of IG Fathenindustrie, is described

Glycerogen was used as a substitute for alveerin in cellulour films, sausage casings, printing pastes, pharmacenticals ,ere and its airrated product was used as a substitute for NG in dynamites.

GM-1 (Liquid Nitrous Oxide), was used as a fuel booster for simplane engines (CIOS 23-18, n 5).

GP (Powder). A powdered sodium picrate combined with e binding agent such as feeten \$5 (copolymer of burndiene and seyrence). It was used as a propellant in Panzerinuse amountaine (CIOS 25-18, p 28).

"G" Pulver ("G" Propellent) (Known in the German Sir Forces as "K" Polver), it is a "cool" smokeless propellane developed before EVE by Gen thin Gallwitz and collaborate

Historical; The use of aicroglyceria (NG) propellance had the following disadvantages:

n' Glycerin needed as the starting material for NG was obtained in those days from food materials cooks fare and oils which were in short supply during the war, Note: With the development of synthetic methods of manuf of glyceria there probably will be so shormer in future

b) The manuf of NG propellants involved some danger to personnel, particularly during the rolling and ex-

cruding operations c) NG is comparatively a slow and paor relatinizing seent for NC:

d) NG propeliants are "hor", i.e. they have a high Kear of combination and a high flame temperature which results in a rapid erosion of the run barrel and a decrease in

its appricable life. Note: The marked effect of the heat of combustion on the gun barrel, (crossion), is shown by the following example: a gun uning a propellant with 950 heal/kg was good for only 1700 firings, while one with 820 heal/kg could stead

3500 firings, ... Due so whe above disadvantages of NG propellunts. work was started in Gelmany about 1934 under the direction of Gen U. Gallwitz to develop a propellant which would be less erosive than NG propellants and as the same time possess the high bullistse potential required for muzzle velocities of the order 3300 ft/sec. . ?

At first natroelycol (ethyleneglycoldinitrate) (EGDN) was creed as replacement for NG, but this proved unsuccessful due to the extreme volatility of EGDN even at moderate pemperatures: Then, in 1935, Gen Galtwick proposed use of hirrared "Folvelykol", & product essily available from non-lood materials, Polyglycol, which is a mixture of diethyleneglycoldinitrate (DEGDN), (called in Germany Diglykoll with a small amount of EGDN, was considerably less voiscile than straight EGDN and although it was more volatile than NG. 's could be used in moderate climates such as in Europe, it proved however, to be unsuitable for stopical climates, such as in Africa.

Polyglycol (or straight DEGDN) was a better gelatiniser for NC than NG, but the most important fact was that it produced considerably "cooler" (calonific value about 696 kcal/kg) propellance than it was ever possible to obtain with NG. The diminished erosion protonged the life of gun barrels to a much present degree than was expected. (See agest Eresies of the Base).

The new propellant was called \*G\* Pulver (G stands for

the first I free of Gallwitz).

Due to the fact that "Polyglybal" (or straight DEGDN) is a most pelaciniser for NC, it was jugaible to preparepropelleurs more honogeneous than NG propelleurs and with annother surface grains, blansfacture of "G" propellants. aspecially the rolling operation, was much tooier and lear designeous and se rolling flave (often observed in NG propellents) were observed. Another personage of G prescillants was that they permitted the incorporation, without becoming bristle, of materials which do not take part in the gulatiannotion, such as, K 'nulface (flash reduces), nicrogenmuline (MGe), orc (See also "Gedelpulver").

Being a good gelasininer, DEGDNmay word in smaller

markies then MG and in a wider mage. For instance. while the amount of NG should be 40-43% for optimum re-celled DEGDN may be used to the range of 20 to 43%, the remainder buing MC ambiliner (nuck un treatestion, or scardien) we set the following; prethance, phthalaces, flack sourcess (such as K sulface or MGs), vangline, graphice, Mg paide, sec.

One such propellages 61,53% of NC (blend of soluble and involute MC giving an average airrogen content 12.2%), 26.37 of DEGDN 7.50 of pthyle querality, 1,60 of vaneline, 8.65 of phehalote, \$.25 of Mg anide, 0.1 of graphite and 2.00% of E sulface had a calorific value of 690-700 heal/kg 

then MG (4-) times more Volatile) and in unmittable for

Page 100 (100) terms transpe had "study justs" "O" propulates design the Abricas Transpolar, Gen Gellurius propulates design the Abricas Transpolar, Gen Gellurius propulates design the histonest propulate (TRO), (celluri Trighylat, in Gentines), Tright asian tel product. (TEGON) was only alighdy more validile than MG (about 135 timen) and was quite suitable for het climates. The replacement of DEGDN by TEGDN permitted the production of propoliones with even lower calculie value than the ending "G" procellents. For instance one containing 56.55% NC (a bland with an average N courses of 12,2% 25.16 TEGDN, 12.00 other controller, 0.25 MaC. 0.10 smale he, and 4,00% E sulface had a calorific value of 650 kgul/ka

TEGON presents the pant advistages from the point of view of its minejaining properties as DEGON and liberine permiss the justiceperation of non-gelectainers such see K sulface and MGs.

"O" preprinces nee slow burning and are ufficient in wanpent /where is projectile truning in the barrel long enough for complete combustion of the propellant. All kinds of good large howitzers and metters are in this class,

All of these weapons have sufficiently long heirele for 'complete combustion of the power, "G" propullant in finhe form were found manimble, however, in medium and small caliber; howitzers and morners because a plojectile does not remain for a sufficient time in the barrel for complete combustion of the propellant. In these cases "Godol" patpellance were found to be quite suitable. (See also, "Gudelpulves", Erosion of the Bore and under Propeliners).

German Artillary mundo of minorition Parmanagus ition and Kuruschmunition

A) Elekatramunition oder Petrotramunition (Oue-slace annualtion or carridge assumition). It is an assumition the complete round of which may be looked into the treapen in one operation. This corresponds to American lines ammunition. The complete round consists of a cartridge case, toutsining a primer and a propelling theres. The case "is personnelly estimed to the proincerte.

Eg: Rounds wood in AA gune, caliber 20 mm 28 mm; 30 mm; 37 mm; 40 mm; 42 mm; 50 mm; 75 mm; 86 mm; and 105 mm.

Note: The Germans designated the caliber of suns in consimeters but we designated them in willimeters in order to conform to the American neaction

B) Kartuschmunition oder Getreenremmitten (Separated cartridge amounition) in an amounition conductat intermediate between American ventifited and separateloading communition. It consists of a projectile which is placed into the weapon first and a cartridge case (containing a primer and one or neveral begs with propelling charge), which is loaded into the breach afterwards. The cartridge case is not fixed to the projectile. The number of burn with propellant could be varied according

to the range requirement, at the place of firms." Notes The Germans employed carridge cases for all their in order to prevent the escape of gases to the rear of the wearon when the brench is special; they never

and the rounds corresponding to the American aspurant loading ammunition.

The Kartuschenmunition was used in some 75 mm sounds no well as in 103 me, 150 mm, 170 mm, 210 mm, 240 mm 200 mm. and 353 mm year, or howitters.

The German Artilles projectiles as well as numerous capoured Austrian, Balgina, Casch, Dutch, Franch, Polish, Russaish, Russian and Yogonlav projectiles used by the Gemons during WW II are briefly described in TM 9-1985-1 pp 358-544. (See also Smoke Projectiles).

Following is the list of these projectiles, arranged by calibra together with the references to Th 9-198-3. 11 20 mm included: Oerlikon AP, Mauser AP, Solothurn AP.

Oerlikon HE. Manner HE and Solothum HE are described is TM 3-1985-3, pp 358-60

2) 26/20 um included; HE 2.8/2.0 cm SparPair and AP Page ased in Inpered Bore Gun, PaB 41 (pp 371-5) 3) 30 mm included: AP, HE, HE-T, AP with Core and Inere-Looded projectiles used in Solothurn AC Guan (pp: 379-82) 4) 37 am iscluted:

a) HE-T (3.7 cm Spgr L'opur) uned in Naval C/30 Gus (p 382)

b) AP Without Cap (3.7 cm Pxar) used in Pak (p) captured from the Polish (p 382) c) Rudded Somb (3.7 cm Stielgeman, 41) need in

Pak 41 (p \$83) d) AP Without Cap (3,7 cm Puge Past: 18) used in Fink 18 and Fink 36 (p 384)

e) HE (3.7 cm SourPatr '40), aned in Pak (p 185). f) AP Without Cap (3.7 cm Px at Patr) used in Pole

(p 306) a) HE (3.7 cm SparPatr-ung) - word in Pak (p. 386) b) HE (3.7 cm SparPatt C/30) word in C/30 Gus.

(n 388) 5) 40 mm included: HE (4, cm SpgrPntr), and HE-inc (4 cm Re Soge Post) weed in Flak 28 (po 380-9) 6) 42/28 mm included:

a) RE (4.2-2.8 cm Spar Parr L. Pal: 41) aned in L Pak 41 (Tapered Bose Gen) (p 374) b) AP With Core (4.2-2.8 cm Page Pate L Pak 41)

used in L Pak 41 (Tapezed Bose Gun) (p 574)

a) AP With Tungston Carbide Core Arrowhead Denim (4.7 cm Pagi Pate 40) med in Creck design tureses bere man Pak (t) and £36 (t) (p 375) b) HE 14.7 cm SparPatt 36) used in some Cauch daniga guris (p 350)

c) HE Asseries denigs [4.7 cm SparPatt (6)] noed in BShier K (3) (p 391) d) APC [4.7 cm Page Page 36-(t)] used in Casch

deales sees Fink 37 (c) and Pak (c) (p 392)

a) AP With Tungates Carbide Corn, Arrowhead Desim (5 on Past Past 40 KwK) used in the Tsak Gan, 5 cm KwK (p 376)

b) AP Without Cap () on PagePate KwK) saud in KwK (p 394) c)'HE (5 cm Spar Pair 38) mand in KWK 39 and Pak 38

d) APC (5 cm Prig Patr Ewk) used in the same gues as above (p 395) e) HE-Inc-T (5 cm Br SpgrPaix 41 L'apur) noud

in Flok 41 (p 397) 1) HE Mortus projectile uned in 5 cm LGr W 36"

9) 75 mm included:

a) AP With Tungsten Core. Acrowhead Design (7,5 um PagrPatr 41) used in the Antirack Gun.

b) HE (7.5 cm Spar Part KwK 34) and AP With Ballistic Cap and AP Cap (Pagr Patr 39 KwK 40) used in KwK, KwK 40, SnuG 40 and Pat 40 (p 398) c) HoC. Type 39 [7.5 cm GrPatr 39 (HD) ] used in GebK 15 (p 399)

d) HoC [ 7.5 cm Gr Patr 38 KwK (HL) ] used in KwK. StuG. KwK 40, StuG 40, GebK 36 and the Recoilless Gue for Airborne Troops (LG 40) (p 400) a) HoC [ 7.5 cm GrPatr KwK (HL/B) ] used in the

same guns as above (p 401) f) Smoke (7.5 cm Nbar Patr KwK) used in the annuguns as above (p 402) ' (See also Smoke Projectales) g) HE (7.5 cm GebG 15 Aluminium) used to GebE 15 (p 403)

b) HoC (745 cm les) used in LIG (8 and 1. Gel) IG 18 (p 404)

i) HZ (7.5 cm lgs 18 AZ/23 hA) used in LIG 18 and L Geb 16 18 (p 405) i) HE: (7.5 cm SpacPatt 75/50) used in Skeda

Dual-Purpose Gua to 406) k) HoC. Type 38 (7:3 cm GcPetr 36 HL/A) used in LFK 18 (p. 407) 1) AP | 7.5 cm Page 40 (W) Pak 40 3 used in Pak 40

(p 408) m) APC (7.5 cm PagePatt KwK 38) used in KwK; StaG. LFK and in Recoilless Gus for Airborne Тамора (р. 409)

a) HoC. (7.5 cm GrPate 38 HL/A KwK) used in KwK at 48. KwK-40. UFK 18: GebK. 36: SinG 40: Pak. 40: FK-16 and Recoilless Gun 40 (p.409)

b) APC:(7.5 cm Page 39 FES) used in Pale 4 40/1, 40/2 and 40/3 (n 410) p) HoC (7.5 cm GrPatr 38 HL/8) used in case

gene as given under (a) (p 411) r) HE (7.5 cm SparPett 34) used in Stult 40 (L./43). Stalk 40 (L/48) and Pale 40; 40/1; 40/2 and 40/3

(p 417) s) HoC (7.5 cm lg: 58 HL/A) used in LIG 18 and L GebG 18 (p 425)

s) Projectiles used in captured 75 mm Belgion, Dutch, Brench, Polish and Yugoslav gunt nes described. on po 410, 413, 415, 419, 420, 421, 423 and 425 of TM

0-10m5-11 10) 75/56 me was the Brandt Sabot projectile developed in France by E.Benndt (9 369)

11) 76.2 mm included, the following projectiles used in captured Russian weapons:

· 'a) HE (7.62 cm Spgr 284/4) used in Gehit 307(c)

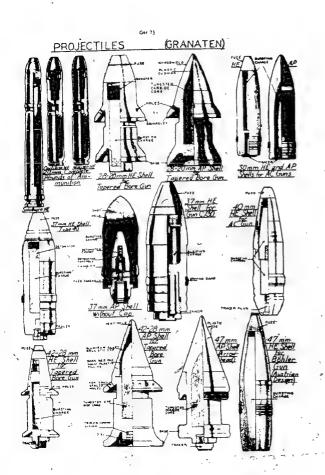

(m 426) b) HE (7.62 cm. Spgr Patt 39) - uned in FE 36 (r) and Pak 36(r) (p 426)

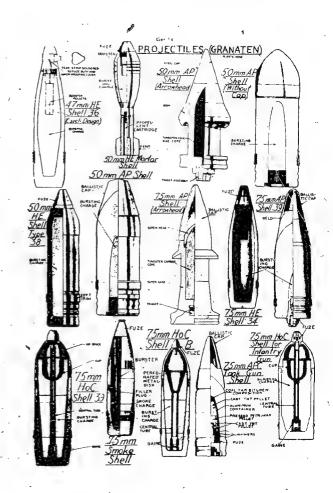

c) AP (7.62 cm PastPatz 40) used in FK 296(s) FK 36(r) and Pak 36(r) (p 427) d) APC (7.62 cm PagrPatr 39 rot) used in Pak 36 (r) to 478) · e) HE (7.62 cm Spgr 280/2) used in JKH 290(c)

f) HE (7.62 cm Spgr 284/4) lused in GebK 307(c) (p 430)

a) HoC (7.62 cm Gr. 38/2 HL/B) used in IKH 290 (r) (p 430)

h) HE (7.62 cm Spgr 39/2) used in JKH 290(r)

12) 76.5 mm projectiles were used in captured Austrian, Czech and Yugoslav 7.65 cm weapons (pp 432-435) 13) 80 mm included:

a) HE Mostar proj (8 cm Wgr 36 and Wgr 39) used in wGr₩ 34 (p 529)

h) Colored Smoke proj (8 cm Wgr 38 Deut) uned in aGrW 34 (p 533). (See also Smoke Projective) c) HE, Smoke proj (8 cm Wgr 34 Nb) uned in Morter,

MGeW 34 and KaGeW 42 (p 532) 14) \$3.5 mm included: 8.35 cm Page(t) and Ge 23/20(t) used in captured Caech AA Gue, Flak H/2 2(t) (pp 436-7) 15) 85 mm included:

n) APC (8.8 cm PagrPatt 39) used in Fink 41 (p 438) b) HE [ 8.8 cm Spg Patr L/4.5(Ku) ] used in Flak 18 Flak 36 and Flak 37 (p 638)

c) AP (8.8 cm Page 41) used in Flak 36 and Flak 41"

4 AP with Tungaten Carbide Care, Type 40 (8.8 cm Page 40) used in Fink 36 and Fink 41 (p 439) e) HE (9.8 cm Spgr Paw(L/4.7 FES) used in Flak 41

and Fink 63 (p. 441) t) APC (8.8 cm Page Peer mBdZ) used in Flak 18. Flak 16 and Fink 57 (p 641)

g) HE, Type 43 (8.8 cm SpgrPaw 43) used in Kwk 43, Stuk 4> (L/71) and Pak 43 and 43/71 (L/71)

h) HE (8.8 cm Page 39/43) used in Pak 43 and Pak 44/41 (0 442) 1) HE (8.8 cm Spgr Flak 41) used in Fink 41 (p 443)

i) HoC (8.8 cm GrPost HL) used in KwK 36 (L/56) (p 4441 b) HE (8.5 cm Spgr L/4.5) used in KwK 36. Flak

' 18, Flak 36, Flak 37 and in Medified Russise AA Gun 8.3/8.8 cm Flak 39 (r) (p 444) 1) HE, with Controlled Emganestation (8.8 cm Spgr

L/4.5 ZiZ) used in KwK 36 (L/56) (p 445) m) AP (8.8 cm Page) used in Flak 18, 36, 37 and in Flak 39 (r) (p 446)

a) AP (8.8 cm Page 39/1) med to Pak 43, Pak 43/41 (L/71) and Stulk 43 (L/71) (Self-prope lied gum) (p

o) AP (8.8 cm Page 39) used in Fink 18, 36 & 37, KwK 36 (L/56) and in Flak 39 (r) (p 448) p) Incredincy Shrapeel (8.8 cm Ge Br Scht Fielt) used

in Fink 18, 36 and 37 (p 448) 16) 100 mm included:

a) HoC proy Type HL/B and Type HL/C are de-acribed in TM 9-1985-3, pp 450-1, but their mass AM DOC LIVER

b) HE Cauch proif 10 cm Dopp 2Ge M 21 (t) ] wand is captured Carch, Polish and Yagoslav Light, Field Houstages (p 451)

c) HE Yugoslav peop [ 10 cm Spgr Dopp Z 311 (j) and Spgs (AZ) 310 (1) ] used in capsued Czech, Polish & Yagoslav Light Field Howitzers and Mod 28 Yuzonlav Mountain Howitzer (9 452)

a) HE Czech proj [ 10 cm DoppZGr 30 (r) ] used is Carch, Polish and Yagoulav Light Field Howstau.s (p =53)

el HE Polish pers \$ 10 cm StgGr (p) 'used in Czech, Polish and Yugoslar Light Field Howstawn (p 455) f) HE German proj (10 cm 5pgr 38) uned in Czech, Polish and Yuspelsy Light Field Howstness (p 454) g) HE Morenz pros (10 cm Wgz 37) uned in NoW 35 (P 533)

17) 105 sem included

4) HE (10 cm Gr 19) used in K 18 (9 4561 b) HE used to K 17, 04 nA and K 17 (p 45") c) AP used in several Light Field Howitzers(pp 4)? and 459)

d) HE (10 cm Spgr L/4.4) uned in Flak 38 (p 407). 4) AP-T (10 cm Page tot) used in Fluk 32, Flak 39, aK 18 and aKT (p 468)

f) AP (10 cm Page tor L'spur) used in Light Field Howitzer (LFH 16). (p 470)

g) HE used in Light Field Howitzer LFH 16) (p 471)

b) Smoke used in Howitzers (LFH 16, LFH 18, LFH 18MB and SruH 42) (p 472)

i) HE for Long Distance Use in Light Field How-

itzers 18 with Muscle Brake (LFH 18MB) (p 473) i) HoC Type A, HoC Type B and HoC Type C used in the same Light Field Howitzers as listed under (h) (pp 474-77)

k) HE, Model 15, Model 23 and Model 28 used in the 10 cm Skods Howitzer (pp 477-60)

1) HF (10 cm Sper Patr L/4.4 Ku) used in Flak 38 and Flak 39 (p 480)

m) HE (10 cm Gr.19 Kz 13) used in sK 18, KT and IgKT (p 481)

n) HE proj with disintegrating band so described

briefly on p 369 of TH9-1985-3

p) Projectiles weed in captured 105 mm Belgina, French, Polish, Russian and Yugoulav guns are described on pp 459, 461 and 463-467 of TM9-1985-3 n) HE (10 cm FHGrStg mR 11) used in Light Field Howitzers: FH 18, FH 18/1, FH 18/2, FH 18 -M. FH 18/39 and FH 18/49 (p 536)

18) 122 mm included HE projectile 12.2 cm Spg: FEW(i) used in captured Russian guns K 390/1 (r) and K 390/2 (r) (p 481) 19) 128 mm included:

a) HE (12.8 cm Spar Past L/4.5), described briefly on p 482

b) AP (12.8 cm Pagr FES) used in Flak 40 (b 483) c) AP (12.8 cm KPS) used in Flak 40 (p 483)

d) AP (12.8 cm Page 43) used in Flak 44, selfproperled (p 484) 20) 150 mm included:

a) HE With Disinsegrating Beads, Sabot Type (p 370) b) HE [ 15 cm AZGr 37 (t) ] weed in Czech Medium Howitzer # FH 25 (t) (p 485)

c) HE (15 cm KGe 42) used in K 18 (p 486) d) HoC (15 cm Jgr 39 HL/A) used in Stull 481./12)

and s (G 33 (p 486) a) A/C (15 cm Gr 19 rot Be) used in K 18 and K 39

(0.487) f) Crech projectiles, such as 15 cm GrM 25 (t) (n 488), 15 cm AZGrM 34 (t) (n 488), 15 cm MinGt M 13/19 (t) (p 489), 15 cm MasGr 28 (t) and 15 cm MinGr

M 28 (t) (p 490) used in captured CzechField Hawitzg) HE (15 cm ]gr 38 FES) used in the Assault Howstate Stull 43 (p 491)

h) AP (15 cm PxSpgr L/37 milbe) used in K 18

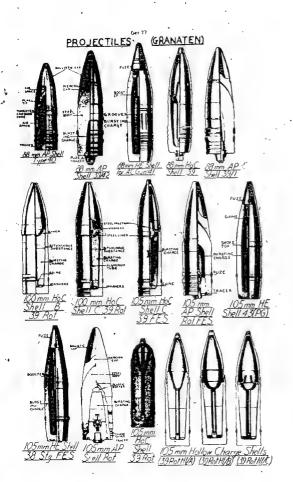

i) HE (15 cm Gr 36 FE3) used in sFH 18 (p 492) 1) HoC (15 cm Gr 19 HL) used in sFH 18 and sFH 13 (p 492)

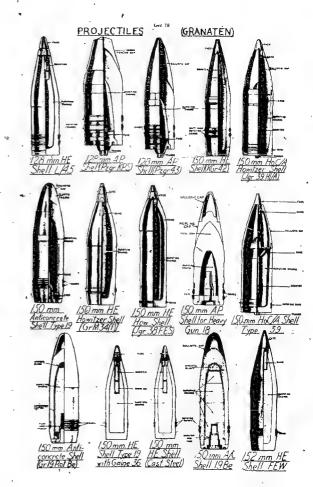

k) A/C (15 cm Gr rot Be) seed in K 18, K 39 and in K (E) (p 493) I) HE (15 cm Gr 19m Zdla 36) used in aFH 18 (p 494) m) HE proi of case seed (15 cm Gr 19 Stg) used in

#FH 18, #FH 13 and #HT (p 495)

n) Smoke (15 cm Gr 19 Nb) used in uFH and sFit 13 (p 497)

PROJECTILES (GRANATEN)

o) Smoke (15 cm [gr Nb) used in alG 33 (p 497) (See also Smoke Projectiles ! p) Rodded Bomb (15 cm Stielgranste 47) used

\*1G 33 (p 498)

s) HE (15 cm Gr 18) used in aFH 13 (p 500); HE (15 cm ] gr 38) uned in siG 33; HE with Base Fune and Bailistic Cap (15 cm Spg L/4.4 Bd Z mir Hauba) used in Ki Mrs Laf (p 504); HE with None Fuze (15 cm 5pg L/4,6 Km) used in K39 (p 504).

a) SAP (15 cm Hpage) used in K 39 (p 504) t) AP (15 cm Page) used in K 39 (p 504) u) Smoke (15 cm Gr 38 Nb) used in #FH 18 (p 506) v) A/C (15 cm Gr 19 Be) used in sFH 18 (p 507)

w) APC projectile for unknown weapon (p 509) x) Rocket Assisted Projectile(15 cm RGs19) (p 509) 21) 152 mm included the following types used in

captured Russian weapons: a) HE (15.2 cm Spgr 436) used in KH 433/1, (r) and XH 433/2 (r) (p. 510)

b) A/C (15.2 cm Gt 434 Be) used in the same weapons as above (p 511)

. 22, 155 mm included the following projectiles used in captured French (f) and Polish (p) Wespons a) HE [ 15.5 cm StgGr 422 (f) ]used in K 418 (f),

% 419 (f) and K 420 (f) (p 512) b) Smoke [ 15.5 cm Gr 427 (1) ] used in K420 (f)

(a 512) (See also Smoke Projectiles) c) HE [ 15.5 cm Gr 417 (I) and Lange 415 (I) ] used in sFH dia (1) and sFH 17(p) (p.513-4) d) HE [ 15.5 cm Gr 421 (f) ] used in 15.5 <m

K 420 (f) (p 515) 23) 170 mm included:

a) HE(17 cm KGe 38Hb) usedin Ki Mes Laf (p 516) b) HE (17 cm KGr 39) used in Ki Nes Laf (p 517) 24) 324 mm included the HE proj [ 19.4 cm StgGr '486 (f) used in captured French Railroad Gua, K(E) 486 (i) (p 517)

25) 200 mm included the HE Mortar Projectile 20 cm Wgr 40 (p 534)

₹ 26) 203 mm included: a) A/C [ 20.3 cm G: 503/2 Be (t) ] used in captured Russian Heavy Howitzells H 503 (c)

and H 503/2 (r) (p 519) b) Flare projectile (20.3 cm Learnigt) used in K(E) (p 520) (See under Flares) .

c) HE [ 20.3 cm Spgr L/14 Kz (Hb) and Spgr 1/4.7 Ka mHb used in K(E) (p 521) d) SAP (20.3 cm Spgc L/4.7 BdZ mHb)'used

in K(E) (p 520) 27) 210 mm included A/C proj (21 cm Gr 18 Be) used in Mrs 18 and in 1g Mrs 18 (p 522)

28) 240 mm included: a) HE (24 cm Spgr 1/4.5 BdZ mHb and Spgr \_L'4.2 mHb) used in Theodor Bruno Radway,

Gua, ThBrK(E) (p 524) b) HE (24 cm Gr 40) used in Czech Heavy Gun, sK(t) (p 525)

291 280 mm included: a) Rifled 28 cm projectile, its comenclature and uses are unknows (p 516)

b) SIF. Rocket Assisted Rifled proj (28 cm RGs 413 and Gr 351 used in K 5 (E) (p 527-28) 30) 35\$ mm included A/C project (35 cm GrBe) for

how, (zer Milp 129 (Its caliber was also given as 355 mm) 311 380 mm included HE Moriat prof (38 am Wgr 40' and Smoke , to 138 cm War 40 Nb/p 59%

Groben Bluttchengulver, Large Grain Smokeless Probellant formerly used in larger caliber German guns is described in Daniel, Dictionaire (1902), p 364. Grundlading (Base Charge). This term applies to the base (main) charge of a bleating cap or a detonator or to a special ignition charge mentioned under Ignition. it does not, however, apply to the main charge of a pro-pultant, which is called Housekertusche (See also under Cordite Charge Casings)

G-Sals is one of the names for Nitroguanidine, also colled Niga; it is abbreviated in this work as NGu.

Gudelpulver (Gudol Propeltant), invented in 1937 by Dynamit A .G. may be considered as a G Pulver (DEGEN-or TEGN propellant) in which a large amount of nurvausaiduse (NGu) is incorporated.

As G Pulvet is slow burning in comparison with NG people lance, it was found unsurrable for use In medium and small caliber morrars, and howizzers. This is because the barrels of these weapons are "no short to permit complete combustion of the G Pulve while the projective is still in the sun barrel. In order to obtain satisfactory results in such weapons, the rate of comparison of the propellant should be higher than in the regula. G Pulver but at the seme time its tlashlessness should be low. This can be

achieved by incorporating into the G/Pulver some nitroguanidine (NGu). -

Due to the fact that ditrated glycols contained in G Pulver are good gelatinizers for NC, comparatively, large amounts of NGu can be incorporated without making the propellant too brettle (NGu is not a celatinizer for NC and is not gelatinized by nitrated slycula). In order to have a propellant of good performance, the crystals of NGu should be short and fine and uniformly distributed throughout the gave of the propellant. This was accomplished in the following

After preparing the nitrocellulose - dinitrodiglycol for dinitrotrialycol) jelly by knesding in a Werner-Pfleiderer apparatus, short fibered nitroguanidine

was pradually added and thoroughly incorporated. Then the mass was rolled for about 25 minutes

and the resulting sheets cut to the desired size. Following is an example of a flake Gudolpulver suitable fo. howitzers: NC(N=13%) 38.03, DEGDN 11.12. NGu 30.03, acardite 0.50, MgO 0.25 and graphite 0.10%

Nitroguaniding was also found to be suitable for incomposation in cool tubular cannon propellants, as Tor instance: NC(N=12%) 39.48, DEGDN 16.92, NGu 30.00, ethylphenylusethane 5,00, diphenylusethane 4.25. a nitrate 4.00, MgO 0.25 and graphite 0.10%.

Other formulations of NGu propellents are given under Propellages.

Among the advantages of NGu propellants may be cited: law eronion of gun barrels and practically complete absence of smoke and muzzle and breech flash. This was achieved without addition of any

flash reducing agents such as K SO... AA guns or those used on atmored vehicles, the problem of breech flash became of utmost importance because the breech has to be opened immediately after each firing and less time is given for cooling the chamber gases (than in the case of slow-fising weapons. It should be noted that modern tapid-fire weapons s provided with semi-automatic breech closures and muzzle brakes. The brakes tend to retain the gases back in the backel and when the breech is opened, the gases emerge in a glowing condition, endangering the lives of the personnel and are capable of igniting any combustible or explosive substance in the vicinity. With Gudol propeliant this breech flash was practically eliminated, (See also "Flash Reductants in German Propellants").

Guidance Systems for Missiles. The principal German devices for guiding space-traversing numeroned missiles which canted within themselves the means for controlling their flight paths, are listed below and in some cases briefly described in References 1, 2 & 3. The systems may be subdivided into the following groups:

those the conding to Ref. 2, pp. 216-19 a 229, the original feeture the conding to Ref. 2, pp. 216-19 a 229, the original feeture the conding systems was called Keenjeh and the later recognition from the condition of the condit ol which was ren to a single stage supplifier and weaky couper. The assembly was mounted at an angle of about 50° to the axis of the body and the sound passed into the disphraga through a series of sure meah access which served to attenuate differences of air pressure due to neutron but not the sound of motors and propellers of commy sircrafts. A small lyre strengement was attached so the vibrating system in such a way as to broaden the mechanical resonance curves of the individual components of the system. If the missile, such as an X-4 was boming meanatean recommend curry; or me motivation, considering of the system. If the missific, such as a missification of the system is the considering consistent of the system of n light displaying actuated inchasism which responded to the sound of yingless people as a range of 15 maters. It was conserved on the same principal to the same of the sa

tion Cooleman System. This was exagentially similar to a frogerings qualite guidance. As with a pan for suchase filey, a missile such as a V-2 (A=0), was shared in the desired interval of the control o the motor. For courol in aximuth, the external and internal vanes, were interjocked but they, were no connected as to permit separate control in pitch, (Ref 3, pp 36-8 as to

583-47

regulated in flight by fins which were positioned by bydmulic servo-mechanisms controlled by an elaborate intelligence system. This system consisted of:

Two gyroscopes to provide scability about the three axes or the missile

b) Radio (optional) to provide azimuth control by flying

c) Radio or integrating accel-rometer for turning the motor at a specific velocity, to provide range control d) Time switch control to bead the missie over toward the target after it was launched vertically.

After elaborate preparations requiring much time, personnel and equipment, the V-Z was fired vertreally itom a metallic launcher. A few seconds after the V-Z was in that sir, the time switch control caused the missile to beed gradually over in the direction of the target. After to been gradually over in one direction or the target, niter I minute of flight, the motor was turned off leaving the missile at about a 45° angle and having a velocity of about 3,400 mph. For the remainder of the flight, the V-2 followed

the trajectory of a free body in space seaching a maximum height of about 30 miles before returning to the surface of the earth. About 5 minutes after take-off, the V-2 struck the earth some 200 miles from the launching site with a reiocity of approximately 1,800 mph causing the warhead and any remaining tighting explode C. infrared (IR) Geranica System consisted essentially

of a concave narco directed toward a target entating the infarred sendatation. A rocating date and a photocell-connected by a wire to a mechanism requismed the district of the control of of a concave mirror directed toward a target smitting

simple, rugged and reasonably reliable; in this system the azimuth was controlled by a magnetic compans, the altitude by a barometric altimeter and the tange by an air mileage menauring unit. Prior-to hunching the minasie, the devices were manually set for the desired course, skittude and range. The compans was linked to the disce-tional sproscope, whereas the altimeter, acted directly on she levator control system. All of the controls and amplificets were preumatic and the high-pressure air was stored in two tinks. When the predetermined range was reached in Highr the warhead was actuated and acmed. The controls were then locked causing the missale to dive. The accuracy of the remainal portion of the flight depended upon the balliance of the musule. (Ref 3, pp 35-36, 327-8 & 335-7). For more information on guidance systems for V=1 see Ref 2, For more information on guidance systems for V-1 see Ref 2, pp. 207-9, Some V-1 bombs were equipped with sone-tube radio transmitter for enabling the leanching crew to follow cities thights with direction finding suppress in order to obtain plotting and wand data (Ref 2, p 700)

E. Reder Guidance System or Redio Detection and Guidance System was not sufficiently developed to be used on a wide scale. Radar tracking of the maget was used for guiding the Vasserfall and Rhemtochter misertes (Ret 2.

of a radio receiver (located in a missile), a missile tracker and a main manamitter (focased near a missile launcher) and a radio transfer uncomen to the receiver. This system was used in the majority of German guided missiles in-cluding the PC 1400 RX Glider Bomb (Ref 2, pp 495-6), Hs 117, called also Schmetzerling (Ref 2, p 196 & 199). Hg 117, called also Schmetterling (Ref 2, p 7 95 & 1999), a 25 A-1 (het 2, p 2 10 & 20 5), as 290 (het 2, p 2 10 d), a 20 5), as 290 (het 2, p 2 10 d), a 20 5, as 290 (het 2, p 2 10 d), a 20 5, as 20 5, as 20 6, as 20 6

The following German radio controlled systems are listed or briefly described in Refs 2 and 3:

red of tracily described in Acts 2 and 3:

Bengand system; consisted of an optical (visual) missale tracker, "Anipped, with a joy stack courtol, a radio-receiver Sweasbear and a 'transactior, Red'i. The Stressburg McIll combination was said in the PX-1400 glider bomb. Schmesterling (Hs 117) rocker, Wasserfield (C-2) vocted and Green Enziam rocket (Ref 2, pp 13-4), 273 & 232 and Ref 3, pp 13-6).

Note: As a substitute for the Strassburg-Keld command link, the Krun-Brigg system was developed late in W-II

(Ref 3, p 41)

p 41) Eleas system was similar in operation to the Burgund's, except that radar tracking of the marget teplaced the optical tracking, fr was proposed for use with the Rheintochner 3 and some other missisies (Ref 2, p 227 and Ref 3, p 41)

c) Some radial guidance system was based on the method which a pavisaror of a ship uses to determine its position by plotting the reverse branngs obtained its position by plotting the reverse bearings obtained from the radio; transmitters of two knows locations. The device Some was more complicated than the systems used in sall; navigation, A brief description of the principles applied in the Some is given in Ref. 3, p. 397. d) Frienticke & Napiner mado receiver, first mounted on a Hs 293 missule proved to be too heavy and complicated for use, it was replaced by the Sters radio

on Strength (no. 1.59) is the first than the first

(a) Köppe melio control system designed by the Tele-funken Co was intended for use in Enzian massiles

(Ref 2, p 232) G. HIM Community substance Systems. Owing to the fact that saids command guidance systems are susceptible to electronic consecurious area (naming h) a control by wires was developed. The systems was installed in the X-4 six-niz missalle and with planned to be installed on the X-7 metage-to-nic missalle and own (nameho missalles (AR Z. Pp 20) a 216-17 and Rel 3, p 41). The wire links system was effective over about distances without less of enemy

conntensessures.

According to Ref 2, p 217 the wire controlled system used in the X-1 missile consisted essentially of a small optical joy-stack control target tracker mounted in the opiness joy sixes toutest wires and a receiving unit in the manule consisting of a gyroscope and a pair of relays. me manuale commissing of a gyroscope and a pair of relays. The control unit is the plane contained two revolving drams, one of them controlling azimush and the other elevation. The control wars consisted of two insulated on the control wars consisted of two insulated of two ins ni pir urmad Swedush spring-rised, virus 6000 m in length, and 0.227 min Jailmenter, Lei urcivirus justi in the insente consisted of a polarized relay for azimuth control and an anapolacized marginal telay for elevation control. The first tasky responded only no polasity, changes in the direction of current flow through the write valid in the marginal relay in the control of the elevation control signals were transmitted simultaneously over the same pair of wires. The telays were connected to the spoiler solutioned in the tail fine, shrough the gree communior system. This arran general converted the left-right and up-down signals into the proper pulses which were

and updates signals into the proper pulses which were fad to the solveoid a fermious, the spollies: The power supply consisted at a small 9-volf dry\_hattery located in the airctroop of the missille. Note: The mechanical difficulties encountered in earlier models were solved by paying out the view tools are proposed to the control of t

simultaneously (such as the Mr. 202 Highler, plane), According to the description given in Ref. 3, pp. 41-2, the leaseching and guiding of the K-4 missile were conducted as follows:

1) The missile was sined and launched from the parent

2) Simultaneously with this, sections of wire were ejected by means of black powder charges located in the wire ten by means on blass powers canages locates an aw warpools, one in the ampliant, another in the missile.

Then lesgth of insulated steet wire in-each spool was
12 har and there were the additional steels containing
18 has of wire located on opposite was tips of the X-4
3) Immediately after launching the X-4, the gyroscopic
astepilos (located in the missile) was put into operation, forested of Contract in the minus[2] was your into operations the washed became aread for easily deceasation and lasers (Lectured on the wing tips of the X-1) were quired [A. An the X-1] were proposed to the proposed of th

nation problem and a single gyro was sufficient to properly orimat the pitch and yes signals as the missile

6) To prevent the inductance of the wire on the spool from discorring the command signals, one continueter of impulscion of sact turn of wire was removed in order

implacion of mach twee of wire was removed in order; on occasion about food in wholes and occasion restricted the maneuver hilly; of famoching planes and required the maneuver hilly; of famoching planes and required that they remain in the "citizing of similar, has exposing themselves to the weapons of enterey's bothers, the state of the control of

sthdraw stacif beyond the mage of enemy bombers weapons.

The following varieties of wire command links systems briefly described in Ref 3, pp 41-2: ",

a) Dortmund-Dulsburg system consisted of an optical

'joy-suck control unit, a manamitting unit, two spools - ith wires (as described above) and a receiver located in the furniage of X-4. The transmitting equipmen cognisted of an oscillator (operated by pulses from consistent on an oscillator (operates or pulses, from the joy-stick control); and an audio power amplifier which transmitted two audio-frequency signals through wires to the receiving set in the missile. The audio signals were demodulated by the rebeyer to pperate two polarized relays, one for pitch and another for

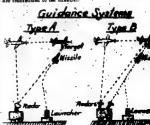

yaw control t
b) Decen-Detroid wire command link was a simple direct-current device which employed no vacuum rubes.
The simula were transmitted to the receiver, which consisted of three relays. The lat relay was sensitive consisted of three relays, like list relay was sensing to the polarity of he direct current signals (pitch control), the led relay was sensitive in the septimization of the signal for recomption to the control, the led relative to the remaining stress sensitive to the relative to the resolution in this case, the similar business of follow the course of the last command received. system except that insulation was not removed, since it was essential to this system to keep the resistance of wires constant. Near: In all wire control systems, the fall of wire so the parth proved to be a numbers and a bauard.

Note: Additional information on guided missiles, also called Directed Missiles may be found in the following CIOS Reports: 28-56, 29-45, 31-13 and 32-66, which were published in 1945 and 1946 (See also Creat Enzime Condred Missile; Nockers and V-2).

Commitdynomet. A subbestike elastic explosive mass obtained on dissolving collection cotton in NG. This is called also Sprenggelatine (Blasting gelatin).

Gun (Genchütz) See Kanons and also Wespons.

Guncorton-Dynamit. See Trauxl Dynamit

H. One of the abbreviatious for Hexogen or Rezo (Cyclonute).

H<sub>g</sub>, H<sub>10</sub> sic. Hexogen phiegmatized with 5%, 10% etc. Montan wax,

H-1, H-2, H-5, H-8 Explosives, German Ammourtes,

described under Erentusprengstoffe.

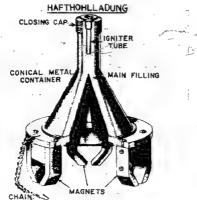

HA. One of the abbreviations for mixture of RDX (Hexogen) and Al (aluminum).

Hefthehilodorg (Adhering or Sticking Hollow Charge). One of the devices consisted of a control metallic container (filled with 3 lb 5 or of a till 10 when was strached an clongated apex, serving as a hand gop and contg the exploder peller (PETN/Wax) and a pull (inction) delay igniter (4) or 7 seconds). Attached to the base of the conical section was a plywood financework carrying three powerful, horse shoe magnets, a biase chain with a hook was "attached to the finance of the conical section was a plywood financework carrying three powerful, horse shoe magnets, a biase chain with a hook was "attached to the financework, Total weight 3 kg.

The device could be used either as a hand grenode to asia land mue. In the fixer case the cord of the triction ignifer year pulled olf and the greened throws argainst the approaching rehicle. In the second case, the device was buried in the ground, slose to the surface, with the magnets up and with the igniter cool, statched to the ground. At the approach of a vehicle the magnetic attraction caused the greenable nignition of the part and venture of the second of the second

Another magnetic antitank charge is described in Ref I, pp 20-25 under the nature of Penarenheadmins 3, it consisted of a bottle-shaped cardboard container, with 21/3 lb of hollow charge (TNT or RDX/TNT). Three pairs of magnets were mounted at the bottom of the bottle, and a 7/3 see friction spatter was located in the neck of the locde, 70-all weight of the device was 81.

The device was apparently designed to be placed by hand on the tank and the ignier pulled after it has been positioned. If the target was of non-magnetic material such as wood, the charge could be attached by means of a spikes located at the bottom of the device. (pp 262-3).

GRENADES HAND FRAGMENTATH STEEL CAS DETONATOR CLOPE FIRST

In another type of adhering (sticking) antitank hollow charge there were no magnets but a scicky pad (located at the wide part of the conical body) served for attaching the charge to a tank (Ref 1, p 324).

Motimine (Adhering Mine). An amitank, hollow/charge device consisting of a conical container (filled with HE) provided with a flat up and a handle. The wide portion of the cone was covered with a layer of a low nelting colophony-oil planuc resis (mp ca 50°) retained on the surface by means of an open mesh cloth. In back of the flat top, which consisted of sheet metal, was placed a thermitetype charge (Mg + Al + KClO,) and in back of the latter a time fuse. The operator hid in a hole and, at the approach of the tank, ignited the fuse which, in turn, ignited the thermite. Just as soon as the heat of the thermite melted the lesin, the device was stuck (by the operator) to the bostom atmor place of the tank. At the same time the heat of the thermite set off the demonstor and this in turn initiated the main charge.

This device was in an experimental stage when the Reference: E.E.Richardson et al, CIOS Rept 25-18 (1945), OP 23-5-

Hobolunder (Lever Type or Schuko Igniter). See Pressure laniter winder Igniter.

Hocht Gulded Missile, See Pike (Hecht) Missile.

Hellhoff Explosivet According to Ger P 12,122 of 1880, it was prepared by the nicration of purified tur oil, followed by washing, drying and mixing of the nitrotar with oxygen carriers, such as K (or Na) nitrate (or chlorate), etc. It was claimed that this explosive mixture was very powerful. Reference: See under Hellhoffie.

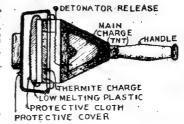

Hellhoffit (Hellhottite). One of the Sprengel type explosives, invented about 1870 by Hellhoff and Ordnon. It consisted of 28 parts of nitrobenzene and 72 parts of fuming nitric soid. This liquid was sometimes used absorbed on kieselgubr (see Gubrheilhoffic). The disandvantage of these Spreagel type explosives was their extreme corrosiveness (Ref 1).

According to Thorpe (Ref 2), Hellhoffir was tried in shells, the two lagredients being mixed during flight exploded on impact (see also Anilithe under French explosives).

Stettbacher (Refs 3 and 4) investigated Hellhoffit and its modifications and found that the glass-lined depth charges (Tiefenbomben) containing Hellhoffit, were much more effective than those loaded with piccic soid. The mixture consisting of funing nitric acid (d 1.52) 64.51, nitrobenzene 25.81 carbon disulfide 6.45 and aluminum bronze 3.23% was found to be one of the most effective. A mixture prepd by dissolving 66.7 parts of dinitrobenzene in 100 parts of fuming direic acid was also claimed to be effective. References:

Hocht Guided Minnile. See Pike (Hecht) Minnile.

Hellheff Emplestives According to Ger P 12, 122 of 1880, it was prepared by the hittation of purified tar oil, followed by washing, drying and mixing of the nitpotar with oxygen carriers, such as K (or Na) nitrate (or chlorate), etc. It was glaimed that this explosive mixture was very poweful.

Ruferenen: See under Hellhoffit,

Helheffit (Helhoftice). One of the "scenage type acroplaniers, invented about 1870 by Helhoft and Granges, It consisted of '28 parts of ultrobensess and 72 parts of tuning airts edid. This liquid was sometimes used absorbed on kieselgubt (see Gubrielhoffit). The disadvantage of these Sprengel type explosives was their externe corrosiveness (Ref 1).

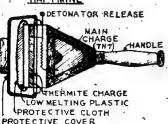

According to Thorpe (Ref 2), Hellhoffit was tried in shells, the two ingredients being mixed during flight exploded on impact (see also Anilithe under

French explosives).

Stetthacher (Refa 3 had 4) investigated Heilhoffie and its modifications and found that the glass-lined depth charges (Tisfenbomben) containing Heilhoffie, were much above sifegilve than those loaded with pieric acid. The mixture consisting of funing nitric acid (4 1.52) 64.51, nitrobenaese 25.81 carbon dissulfide 6.45 and niuminum bronne 3.23% was found to be one of the most effective. A mayure pupp by dissolving 6.67, parts of distirpbenaese in 100 parts of, funing hascit acid was also claimed to be affective. References:

## HAFTMINE

Hongstit. Smokeless propellant, patented in 1888; was based on nitrated pulped straw previously treated with nome chemicals as described in Daniel, Dictionanire (1902), p 373.

Monnchell or Ms. A guided missile (q v ) developed during W II.

Hessilis of Dickeshaff. An explosive prepd by soaking nawdant to a concentrate or aqueous solution of equal parts of pictic acrd and Am nitrate. The resulting product was died and mixed with visitous amounts of nulverized suffer and K, or Na histories.

Reference: L.Gody, Traité des Matières Explosives, Namer (1907), p 531.

Hetser (Baiter). A Czech designed and constructed Tank Destroyer, Jagdpan zer 38 (t) (See under Panzer).

Househvecke (Grashopper). A peries of weapon carriers of mean and the Gamman senty in the WW II. They are described in wel III of the Illustrated Record of German Auny Equipment 1939-1945, Was Oflice, London (1947).

Note: The above British books were not consulted for fear that they are "confidential" or "secret" as is usual swith British sources.

Hexa, Menamin, Mementrodiphenylamin, oder Menyl (Memoisrodiphenylamine) (HNDPhA). Described in the general section under Diphenylamine. The following information concerning the manufacture and use of Hexa in Germany during WW II is available:

At Allesdorf Fabrik of WASA-G. the method of manufacture was as follows:

To a charge of 1000 kg of 99% nitres acid pfaced is a V2A acialism used nisrator of 2 cubfe meet capacity (fitted with aff agitator totating at 60 RPMs a cooling inches and cooling forth) 300 kg of diphenylamine was added gradually while the temperature was maintained at 90. The solution was diluted with weak aftic acid and cooled to 30-40. The precipitated MDDPAs was filtered off, washed theroughly with water, then dried, \$5 acreemed and packed.

MMDPA was said by the Germans at the start of WP in an undertware capicalise containing MNDPA 40 and TNT 50%. During WW II, this explosive was replaced by the one containing MNDPA 27-9, TNT 53-7 and A1 16.4%. Another underwarer explosive container MNDPA 23-0, TNT 61.8 and A1 15.2%. Seathbocker (Ref 9) circa a mixture constitute of MNDPA 28-0, TNT 61.8 and A1 15.2%. Seathbocker (Ref 9) circa a mixture constitute of HNDPA with 30-40% TNT and 16% A1 (See alog Mennatics. Schicanwolle 18. TSNV-1-101 and Erwatzspirongsvorfe). References:

Mexa 5-22, 5-26 and E-4-German substitute explosives containing hexanitrodphenylamine described under Reseatsépengatoife.

Hexadi — German name for Maxamethylanetetromine Dinitrote,  $C_8H_{12}N_4 = 2H_2O$ . (See E.A.-Verfahren under Hexagen).

Manal. An explosive mixture consisting of 75% Hexogen (desensitized with 5% of max) and 25% Al powder; was used in underwater ammunition. [PB Rept 1820.p 40].

Hexamethylentelemin (Hexamethylenetetramine) (HMcTeA), called also Hexamin, Metheneamine, Aminoform or Urotropine, See general sec. 102.

Musum eringim erstementen Dirivettives (Explesives). To this group belong freplesives containing Hempes (BDA) or Cyclemized and Redail (Cyclemized hydrocinitive entire the second of the containing the second of the containing the cyclemized and investigated two explication (ref. gliphate Ninemizes of WE II) obtained as by-preduces in the manufacture of Hempes by the E-Salz and KA-Salz processes.

Both of these substances were claimed to have the containing the contai

powerful explosives than Hexbgen. Reference: G.Römer, PBL Rept 85,160 (1946), p 16.

Hausmanhylenetriporaxidodiomine (HMTPDA) (Hexamethyleotriperoxyddiamia). Preputation and properties are given in the general section. The supplosive use proposed in in the general section. The supplosive control of the instance, the No 8 corper cap might contain 3.1 g of HMTPDA and 1 g of TNT. Reference: C. von Ginewald, Ger Pat 274,522 (applied for in 1912; tuend-the 1914).

Mexamin Ous of the German designations for Hexaattrodiphenylamine. The same designation was ward for Mexamethylenetetramine.

Mexemit, or Mexemit. As, explosive used during WW I for cast loading torpedors, sea mines, and depth charges. It consisted of hexanitediphesylamine (HMDPAA) 60-70 and TNT 40-10%. Its properties are described in the general action.

After remination of WI, the Heramit was used as a component of a commercial explosive known as "Neurodit".

The term Heransic was also used for the following confuserial capitairs: profit from supulse, nanosited of WW 1: 60 to 90, fatts of HMDPLA, in which might be present up-76 40% plorits acid, 10 to 40% DNT, TMT, and/of TNN, and 0 to 4% vegerable small. Reference: J.Papin Luballeur, Poudtre, etc., Paris (1873), pp 47-9.

Note: According to TM 9-1985-2 (1953), p 15, the Hexamit was used in the warhead of Kirs Apparetus (q v ).

Hexenit. Same as Hexamit.

Mexentredicthylnitramine. See general section under Diethylnitramine.

Houseltrodiphonylomino. Same as Hexa.

Here. One of the abbreviations for Hexogen (H) (Cyclo-

Hone (S-19 and S-22). German substitute explosive containing Henogen (RDX); described under "Ersatz-sprengstoffe".

Hanngon er MADX/also called V-Sala, E-Sala, A-Sala, SH-Sala and KA-Sala, depending on the method of manufacture. It is deskibled in the general section as Cyclonite (Cyclotemethylean Trinitramine).

(Henning, Ger Pat 104 280, 1899 ), it was not used as an expionive until about 1935 when its manufacture was started aging the W-Verfalten described below. Four other methods of manufacture were later introduced and production reached its peak with 7,700,000 lb produced during the month of June 1943. Out of the five methods developed in Germany and described briefly below, the so-called Ka-Verfahren proved to be the best because it was the most economical. required less space and equipment and used readily available

raw materials. Following are the German WW II methods of manufacture. aremged is approximate chronological order:

W-Verichron (V-Process), developed in 1935 by Dr Volfram of the IG Farbenindustrie, wan based on the reactions indicated by the following equations, starting from sulfur

a) 350, + 5NH, -> H\_N-SO\_ONH, + HN (SO\_ONH\_); The resulting mixture of Am amisomifonate and Am iminomifonate was treated with a sole of Ca hydroxide, which gave a soluble Ca amiso-sulfonate and a ppr of Ca

b) H\_N-SO\_ONH + HN(SO\_ONH ) + 2Ca(OH) --(H\_N-SO\_O) C. + C.SO . INH OH.

The liberated manonin was recovered and used in reaction (a). The Ca sulfate was removed by filtratide and the Ca aminosulfocate treated with K sulfate. c) (H\_N-SO, O), Ca + K\_SO, - 2H, N-SO, OK + CaSO,

The resulting K national losate was separated by filtration and treated with formal dehyde at 30° at a pH of 3.

d) 'H<sub>2</sub>N·SO<sub>2</sub>'OK + HCHO -> H<sub>2</sub>C:N·SO<sub>2</sub>'OK + H<sub>2</sub>O.

The resulting condensation product, K methylene mainopulson ste, called Weiss-Selz (White salt), was nitrated with mixed at the sultrine acid at 50° in a stateless steel attends of 50° in capacity.

with CIN-SO OK + SHNO - (H C N-NO) + SKHSO

This procedure (which under certain conditions gave yields up to 30% based on the formuletyde used) was fullowed at the Krummel Fabrik of Dynamit A.G until as explosion in 1943 completely destroyed the plant. Othog German plants did not use the V-terlahren because the thought methods such as the Shikh and K-proved to be more

Nous A similar method was patented later by R.W.Schlensler

and J.H.Rosa, U.S. Per 2,434,330 (1948).

2.E-Vorbahon (E-Process), developed between 1935 and
1938 by Drs Eberle and Fincher, was based on the reaction of paratomaldehyde with Am nitrace, dissolved in acetic anhydride, which acted as a debydrating agent: (HCHO)3 + 3NH4NO3 + 6(CH3CO)2O - (H2C-N-NO2)3 +

12CH COOH

The remilsing Cyclonite was separated by means of a autsch, from the scetic acid produced by the reaction, washed with water, stabilized and daied. The finished crystalline product had a mp of only 190-195, and the yields varied between 60 and 75%, calculated on paraformal deby de.

The E-Verlahren was used at the Bobingen Fabrik. Dynamit A G and produced 125 metric tons per month. It was captured is 1944 by the KA-Verlatren which enabled the production to be doubled with the same equipment. Note: The Cyclosiste obtained by this method contained the same impunities as described under KA-Verfahren but in larger amounts.

SM-Verfehren (SH-Process), developed in 1937-1938 by Dr Schnurr was based on the original method of denning (1899), which involved direct nitration of hexamethylenetetramine (called also bexamine or urutropine) with nearly absolute nitric acid, according to the following equation: Cattan + 6HNO - (HaC-N-NO) + 6HaO+3CO2+2N2

A nimitar method, was independently developed by Dr G.C. Hale at Picatingy Arsegal.

The improvement introduced by Dr Scheuts consisted in carefully controlled heating ("cooking-olf") of the contenus of the nitrator directly after the completion of the reaction.

Under these conditions the unstable products formed during the reaction were partly decomposed and partly nitrate-

The nitration in the Sit-process was conducted at "" are namence in the Anterocast was conducted at the phite 90% interesting the purised Cyclosis had any phereoge 200° and 202° C.

While left the original (Kamana's) method the yield was very low (about 40% based on C.H., N. dued), the improved method was much more econobical yields up to 71.5%

were reconsted

were reported:
The Sit-process was used in at least unree plants
of them belonging to the Dynamic A C . Christian mane
for them belonging to the Dynamic A C . Christian mane
for the state of the state of the state of the state of the state
for constant up, to 500 to/mo) and Unknowning (producing
up to 250 to/mo). The Sit-process was considered by be
more economical than the "My E - or E processes; but falenor to the KA- process.

Talestor to the RA process.

A K-Verbehom (K-Process), feveloped by Dr Kapfiller of WASA-G, somewhat large their the E-Verlahren, was based on the following edge-discussions: Yak the theramentyl generated by the process of the Company of the Comp CHINA + 4HNOs / 2NH HO3 - 2(H CNNOs) + 6H 20
Nitric acid of 99% suremath was used and was required

in larger quantity than for the other methods. This made the recovery of apont acid a very difficult and expensive problem. Only one German plant used this method (Elania Fabrik of W A S A G), producing 200 metric tons per month.

5. KA-Verdaheah (KA-Process), developed by Dr Kaöffler of W A S A G was actually a combination of parts of the K- and E-Processes, it consisted in teleming the hexamethyleneretramine dinitrate with acid Am nurate in acetic a) CaH12Na + 2HNO - CaH12Na 2HNO (Hexamethylane-

terramine dinitrate). ,b) C H 2N 2HNO + 2NH NO HNO + 6(CH CO) 0-6

2(H,C.N.NO.) 4+ 12CH COOH

la/this method, considered to be one of the most eco-nomical, paraformaldehyde was not used, because all the necessary CH,- groups were supplied by hexamethylene-seriesine. A similar procedure was developed in the U.S.A. by W. E. Buchmann (See general section under Cyclonite). In the K process, as practiced at the Bobingen Fabrik, amine was keeted with weak nitric acid (35-30%) at a loud 5" and the resulting dinitrate (called in Germany Hoxedi). was dried. "The dry product was dissolved in aceric anwas aned. The cry product was dissolved in acette anyddide\_mang, at standless used vessel 'equipped with a padde-type attract) and then acid Am nitrate (previously peepl by treating Am nitrate with'll not of 100% nitric acid) was added. The resulting solid product was separated from acetic soid, then washed with water and dried. The cyclonite obtained by this method was called KA-Selz. It contained, as impusites, to 2% of HMX (cyclotetramethylenetetra-nitramine, called in Germany Octogon). (H.C.A.NO.), and a small amount of cyclotrimethylene dinitromonoacety online, (CH,) N (NO,) OCH, Higher percentages of these impusities we produced when the E-Verfahren was used. Note: The advantage of the KA-process over the E-process and: He dovuming or the A-process over the E-process was that by using hermanic instead of pseudossidelydereward that the second of the Control of the Contr when the method was changed in 1944 from the line to the KA- process.

from which the next amount of the basis of formaldehyde (from which the next amount was produced), were 80-82% for the KAPpocess, as against 73-75% in the E-process, in the KA-process the production of 100 parts of Cyclosite required 40p of hexamine, 43p of Am nitrate, 68p of nitric acid and 240p of acetic anhydride (of which 195p were recovered as

Summit. One of the explosives invested by Stetthickus See mader Swine Explosives. .

Honoplost 75- A plastic explosive, developed during WW II at the Krimmel Pactory of Dynamit A -G It contained RDX 75, NC 1.2 to 1.4, liquid DNT 20.0 and TNT 3.8 to 3.6%. This mixture was prepd by heating the required amount of RDZ to 90° in a Verner-Pfleiderer, mixer, and blending is wish a small assount of NC. This was followed by the addition of a DNT-TNT mixture and further blending . B noing this order of addition, lumping was avoided.

The mixture was put out in cylinders about 220 mm long by 28 ster in dismeter. Due to difficulty with direct cap initiation, a booster was provided it consisted of compressed, phlegmatized PETN pellets about 40 mm long by 21 can diam and equipped with a decounter well 20 mm.

Nose! This explosive was developed as a substitute: for the plantic emplosive, which used RDX plus American vaseline, because the latter component was no longer available in Germany. This vaseline, balled "long fibrous" by Meyer had much greater adherence than vaselines manufactured in other countries.

bearing. One of the employings invested by Stettbacker-See under Swins Explosives.

Houselest 75. A plastic explosive, developed during WW II or the Erimmel Factory of Dynamit A -G Is contained RDX 75; NC 1.2 to 1.4, liquid DNT 20.0 and TNT 3.8 to 3.6%. This mixture was propd by beening the required amount of RDK to 90, in a Verner-Pfleidezer, mixer, and blending it with a small assessed of NC. This was followed by the addition of a DNT-TNT mixture and further blending . By using this order of addition, lumping was avoided.

The mixture was put out in cylinders about 220 ma long by 28 nm in diameter. Due to difficulty with direct cas initiation, a booster was provided it consisted of compressed, phiegenesised PETN pellets about 40 mm long by 21 am diam and equipped with a decounter well 20 mm

Meen: This explosive was developed as a substitute for the plantic explosive, which used RDX plus American was aline, because the lesser component was no longer available in Germany, This vaseline balled "long filorest" by Mayer, had such greater adirevence than vaselines manufactured in other countries.

Mach and Mindordronkkenson (High and Low Pressure Gun, abservinted to H/L Gun) (Canon à payère, in French). Ir has been known for a long time that the lower the peak pressure in a gun the thinner may be the walls of the projectile. This means that for a given total weight of a assisctile, that used is a gam with lower peak pressure can contain more explosive and de more demans to a target.

Better results were obtained in 1943 when Dr Hermann and collaborators of the Rheinmetall-Borsig A -G constructed the 8 cm PWK (3 (80 mm Antitank Gun). The description of this gun called in French "canon antichar models 1943", wan given by Travers and Touchard (Ref 3). They tilsim that the "curbocanon Delamare-Maze" invented in Frence about 20 years earlier may be considered as the predeceasor of both the fi/L and recoilless guns.

The German aun 8 cm PWK 43 had a comparatively thin barrel with an inside diameter of 81 mm and was 34 ralibers long; the chamber had an enlarged diameter (105 mm) and much thicker walls. The projectile (fincail type, 81 mm in diameter, contained a shaped charge and weighed 3kg) way inserted front in the bord that in acquarate-loading ammunition). This was followed by the carridge (120 mm long and 105 mm in diameter) which contained the propellant. The carridge was closed by mesos of a disc provided with eight perforations (each 13 mm in diameter), When the propellant burned the pressure of the gases developed inside the entiridge was about 850 kg/cm but the pressure acting on the projectale was only 350 kg/cm2 because the gazes lost part of their velocity on passing through the -holes in the disc.

The relation between the high pressure inside the carridge case and the lower breasure in the bore could be varied by increasing or decreasing the size or number of the openings in the separating dist? In order to protect the propellant in the container from spilling and from moisture, the perforated metallic disc was covered with a solid disc of paraffined cardboard,

The halfistics for the H/L gun were worked out by Travers and Touchard in France and by Corner in England. Note: Corner states that towards the end of WW II the Germans started to manufacture two light antitank guns: the 8 cm PAW 600 and the 10.5 cm PAW 1000, but does not describe them. He also mentions the 8.8 cm W71 gun, which was built on the "three-pressure principle" ... References:

Hohiladung (Shaped or Hollow Charge). Considerable work was done in Germany before and during WW. II on the development of shaped charges. Among the most prominent contributors in this field were the personnel of Krummel Fabrik, J D A -G Among the shaped charge weapons developed at Krimmel may be mentioned:

- a) Magnetic anti-tank shaped charge weighing 3 kg; blast penetration of street was up to 250 mm
- b) Shaped, charge: for Faustpatrone, Panzerlaust, Pagzenchreck.etc.
- Note: At Krummel it was yound that the best explosives for

shaped charges were RDX-TNB and next RDX-TNT mixtures. Substituti DEIN for RDX lead to a decrease in efficiency.

The addition of glumiaum powder was devirable but not ... in farze maeriry.

Krimmel was not the only place where work on shaped charges was conducted. Elsewhere the Germans developed a shaped charge shell which was shot from an 80 mm morter called "Panzerwurfkanone", and the wathrade for agreeal suided missiles.

Historical, Discovery of the hollow (shaped) charge (HoC) effect is usually attributed to C.E.Munroe (USA who described the effect in the Amer L Sci 36, 1888. It was claimed by H.Schardin that Max von Forster of Gennary had in 1883 already shown that bare hollow charges gave an enhanced effect along the axis of the charge. The first practical application of the liou effect. change. In a farst practical application of the 100c struct-ico denolition charges, sea mines, to propodes, projectiles erc., was patented in 1910 by E.Neumann. & the West-Ringer-Anhaltische Sweet [1914]. A 1915 Control of the Research of the 1915 Control of the 1915 Control of the Research of the 1915 Control of the 1915 of the HoC effect was done, prior and during WWII, H.Schardin et al in Berlin, Some work was also carried out by A. Stettbacher of Switzerland during this period, Note: According to A.J. Dete, Ordnance Sergeant, October 1945, pp 3-13, hollow (shaped) tharge smmunition twas and by the Germans in many 75, mm callber weasons.
There were at least lour types of such projectiest HiHI/A, HI/B and HI/C. Most of these projecties are listed in this dictionary under Granace and are briefly described in TM 9-1985-3 (1953). Some projectiles of calibers 88 mm, 100 mm; 105 mm and 150 mm also had shaped charges. The coclosed drawings represent some typical German

hollow charges, (See next page). References:

charges was conducted. Elsewhere the Germans developed a shaped charge shall which was shot from an 80 mm mostar called "Panzerwurfkanone", and the warheads for several guided m sailes.

Historical, Eiscovery of the hollow (shaped) charge (hoC) effect is baselly attributed to C.E.Munroe (U.S.A.): who described the effect in the Amer J. Sci 36, 1888, It was claimed by H.Scharlin that Max won Forster of Germany had in 1883 already shown that bare hollow charges gave an enhanced effect along the axis of the charge. The first practical application of the Hot effect charge. The lirst practical application of the 100-c effect for demolithment charges, see mines, toppedoes, proceedies etc., was parented on 1210 by E.Neumann & the Ream Rilach Anhalisache Spraguest A. C., PRP-Ann 95-259), Neumann's were is described to 100 pt. Proceeding 100 pt. 100 p of the HoC effect was done, prior and during wall, by Il. Scherdin et al in Herlin. Some work was also cernied out by L. Stettbacher of Switterland during this period. Noise According to A.J.Dere, Okinance Sergessis, Ocober 1945, pp 3-13, hollow (shaped) charge mmunition has used by the Germans in many 75 mm caliber weapons. There were at least load typen of such projectiles HI/A, HI, B and HI-C. Most of these projectiles are instead in this dictionary under Granate and are briefly described in TW 9-1985-3 (1953). Some projectiles of calibers 88 mm, 100 mm, 105 mm and 150 mm also had shaped charges.

The enclosed drawings represent some typical German hollow charges. (See next page).

Kaasan Englosives, Several explosive hixtures were proposed by W.Kessen of WASA-G. One such explosive was patented in 1938 (Ref 1). It consisted of a regular blascing explosive plus as additional charge consisting of NG and/or nitroglycol mixed with a large amount of alkali bicarbonate. This mixture tended to produce inert gases and to absorb heat. If desired charges containing bicarbonase could be inserted between normal charges. These explosives were suitable for use in gaseous coal mines (See also Bikarbit and under Shaethed Explosives).

'Another patent granted to the same person (Ref. 2) dealt with the manufacture of moist Am nitrate explosives contg carbonaceous macerials.

Keeplt V. One of the permissible explosives developed during WV 1: NG 4, K chlorate 65, Na chloride 14, naprhalene 10. nitroasphthalene 5 and wood meal 25- [ Naoum, Schless-

and Sprengsroffe, Dresden (1927), p 147 ]. Note: According to Mershall, v 3 (1932), p 112, the name Kompit was given in 1931 to Chloratit 1.

K Pulver. Same as G Pulver.

Kroftzahi (KZ) (Strength Number), in the usual determination of power (strength) of an explosion by the standard Trauxi Lead Block Test, (see general section) one of the principal errors is due to weakening of the walls of the cavity, which is observed with powerful explosives such as blasting gelatin, P A., TNT and NG. in order to eliminate this error. Neubner proposed that, instead of measuring the expansion produced by a standard weight often explosive, the weight of explosive required to produce a standard expansion of 300 cc be determined. This may be done by firing several charges of different weights in order to obtain values below 300 ec and above it. After drawing a curve giving the relationship expansion vs weight of sample, the expansion in or corresponding to a 10 g. sample one by determined by interpolation. This calculated expansion is called Kraftzahl (strength aumber).

Table 23b lines KZs for some embosives

Substance	Trausi Tout Values shapeved by various investigators using a 10 g sample	KZ calculated by Neubone for n 10 g sample		
Bleering geletin NG NC(13%) P.A. THT DNR	520 to 610cc 515 to 600 525 to 420 300 to 365 205 to 300 250	534ce 540 400 365 150 511		

Note: It may be concluded from the above values that the KZ values for highly powerful explosives are lower than are determined by the aranderd Trauxl test, while for lane powerful explosives (such as TNT, or DNB) the KZ is higher.

iest (1884) relatinous ine. It consisted of K bunzene or nitrotoluene , Natroglycerin (1928),

Following are some of the achievements of Krummel

Fabrik personnel: A.Pressing of emplorives. In loading ammunition (auch as deconstors, boosters and projections) one of the most important requirements is to maintain the same density of loading for each type of ammunition and for each kind of explosive. As a rule, the effectiveness of an explosive in higher at maximum density, but in some cases such high density is undersirable because it might cause dead-prenning (as in the case of mercuric falminate) or cracking of pellets (as in the case of Note, which is PETN densitized with 10 parts of wanhilbe react required density of charge was obtained by weighing accurately each portion of the explosive d proceeding as described below:

In the preparation of pellets for boossers, the weighed masses of an explosive were transferred to one or two dozen molds placed in portable holders underseathacorresponding number of filling funnels functioned together in perforated places. During filling. loss of explosive was carefully avoided so that the required density would be obtained. After sacertaining that each sold was properly filled, the formed placed the holder with molds under a press located behind a strong wall and operated by response control. Any spilled material was collected and blended with the hext batch of explosive. The pressed pellets were removed and inspected for dimensions and density.

Noon bost of the pressing was done with phlagmatized PETN (usually with 10% wax), which was used to form tharpen for the 37mm tank shell? 30mm solid or hollow .. charges, 20 mm bigh explosive charges, and incendiary explosive charges, colored smoke charges, etc. The 20mm incending charge consisted of about 80 perts of PETN (previously phicamerized with 10% wax) and 20 parts of aluminum. The charge weighed 6.6g. Some TNT charges were also compressed, such as those for shrapnel burster tubes, emplosive charges for some mines, etc.

B. Ejecting projectiles. Special projectiles which elected incendiary missiles on approaching a target (such as an airplane) were developed but did not come to the manufacturing stage. These projectiles contained several hollow steel cylinders, each of which was filled with an incendiary mixture consisting of Ba peroxide, aluminum and iron. A charge of about 15 g of HE was required for ejecting each cylinder from the projectile and to impare to it an acceleration of about 1000 m/sec. Each of these cylinders burned in flight and if one of them hit is combustable object (such as a sasoline tank of an aurolane) s fire or even an explosion could take place.

C. Space explosions with curbon dust. Preliminary work was done on the development of a bomb which was charged with a HE and coal dust, it was presumed that the deconation of the HE would explode the coal dust which would become scattered in the sir surrounding the bomb, thus producing a high pressure (blast) effect at distances as far as 50 m from the center of the explosion. These bombs were intended for antisirtraft Purposes, Experimen's with coal dust were not

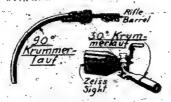

auccessful, but Al, or Mg duses could be exploded in air when charged into a bomb mixed with a powerful HE and a small amount of chlorate. The research was not completed (See also Explosive Powered Vortices) D. Shooed charges. See under Hobiliadung

E. Flash reducing compounds are described separately F. Structural amplantion are described asparately. Reference:

O.W.Stickland et al, General Survey of Explosives Plants, PB Rept No 925 (1945), Appendix 3 and Appendix 7.

Krummee louf (Bent Barrel). A special bene-barrel attachment to a gut, invented by Col H.Schade of the Rheimsgrall-Borsig Co, was available in two degrees of bend 90 and 30. The lirer type changed the course of the buller by a tight angle and was known as the "Around the Corner Gen" intended to be used (in a ball joint) in the pasts of the tank where it was necessary to protect the blind spots. The barrel was 18% long and about I in dismeter. Its range was short and its fire was not accurate, it was fired at tandom because no hight was provided. The second type, bent) have seculd be arrached by means of an adapter to one of the service rifles, such as the MP 44. It was provided with a prismatic optical sight (designed by Zesse), which permitted fately, accurate shooting from behind solid barricade. The operator of this equipment was thus protected from enemy fire: Both berrels used the 7.92 mes short (kurz) bottle-necked carrudge.

A more detailed description may be found in the book: Ph. B. Sharpe, The Ritle in America, Funk & Wagnalte. Co. N Y , pp 636-40.

O.V.Stickland et al. General Survey of Explosives Plants. PB Rept No 925 (1945), Appendix 3 and Appendix 7.

Krummerlauf (Bent Barkel). A special bent-barrel attachment to a gun, invented by Col' H.Schade of the Rheinmetall-Boraig Co, was available in two degrees of bend 90° and 30°. The first type changed the course of the bullet by a zight angle and was known as the "Around the Corner Gua" It was intended to be used (in a ball joint) in the parts of the tank where it was necessary to protect the blind spots. The barrel was 18% long and about 1" in dinmeter, Its range was short and its live was not accurate, it was fixed at random because no hight was provided. The second true (3) bent) barrel could be attached by means of as adapter to use of the service sifies, such as the MP 44, it was provided with a prismatic optical sight (designed by Zeles), which permitted fairly accurate shooting from behind a solid barricade. The operator of this equipment was thus protected from enemy fire: Both barrels used the 7.92 mm abort (kurz) bottle-necked carttidge.

A more detailed description may be found in the book; Ph.B.Sharpe, The Rifle in America, Funk & Wagnalle. Co, N Y, pp 636-40.

LANDMINEN (Land Mines). A great variety of land min-mere used during W II by the Germans as can be sch from the following information taken from References b - G: 1) Austinal: Mine, called Papparine, because it was mad-of special cardiound "Pappa" a non-meralitic subgreace ased to prevent the detection of the mine by electric axed to prevent the detection of the mine by electric detections. Pensauri on the "pressure plage", forced it down care the head pl a glass ignites, containing a causal glass tube filled with a reddink ignition matriace of unknown composition, Causking of the central tube produced a flash which passed to the 'detounter which suppleted the mine. Pensaure on the cardbaard of the mine would not set it off. The mine was filled of the mine would not set it off. The mine was filled to

with 11 ib of TRT (Ref 6, p 261)
Astinack Mise, called Panaerschoolimine, consisted
of a wooden box filled with pieric acid (13,2 lb), There were two types, A and B, very similar in construction. The booster is both cases consisted of 200 g of an explosive such as PETN/wax. Type A was actuated by

The booster in both cases consisted of 200 g of a supplearive use the both cases consisted of programme and the both cases of the case of reo "bear wises; b) Functioning of an antifitials or trap wise; c) Electrically, by remone control; d) Bodys-tap wise; c) Electrically, by remone control; d) Bodys-table lot; w) Reversing of one ignites ZZ 42 with its wings below the each pressive plant so that the chains could function in case an attempt was made to lift the charge (Art 6, pp 26-7) a 272-3) lieavy Asitiank Mise (\$chower Pentromine) was made of cast ions and constants 37 b of Pietric Artis, Tous

se case toos and constained 37 lb of Pictic Acid. Torsal weight was 500 lb. The since was fixed by a downward pressure exceted on the cover plate, which sjivotted on the transiona. This pressure compressed the shair pressure ignities, which fixed the charge. The fains was need for root blacks where action had been natic for a period of time. Togal weight was 300 lb (Ref 6, pp 265-7)

Assizable Minea, called Tollornines (Plate-Shaped Mineal, were of the following varieties; Tellernine 35, Tellernine 42, Tellernine 43 and Tellernine 29. 35. Telletmine 42. Tellermine 45 and Tellermine 29. Type 35 mine entired in two nativities, both of them node of oten and similar in confirmation. The 2nd variety, designated Tellermine 35 (Steel) had the pressure plane made of corrugated steel Tellermine steerings.

They were filled, respectively, with 11 and 12 lb of TNT. Both mines operated by pressure on the lid of 200 lb or more. This depressed the igniter housing and sheared the put holding the arriver in the cocked position. etc. The Tellermine 42 was similar to the 35 except that the pressure plate was similar and did not include the entire upper surface, Pressure of 259 Jb and over forced the pressure cap down. This compressed the heavy pressure plate spring and detonated the mine. The Tibli 43 [also called Pilamine (Mushroom Ming)] was 1.56 1196 43 laws caused resource face to the characteristic as a similar to the Till 42 except that the pressure in was solid, it e there was no threaded hole for the insertion of the ignitive and no screw cup, the walls of the makehoom shaped plate were thin and there was no heave, spring under the pressure. Like Tellgramer 42 it was filled with 12 1b of TNT. The mise operated by downward pressure not the makehoom lid. This churched its light walls and forced the head of the striker down, thus igniting the mine Tellonniae 29 also designated T-5 igating the mine Tellomane 29 also designated, To-was a light antitant more constructed of abeet seed. It was all the author to the seed of the seed of the charge of the seed of the seed of the seed of the designation of the seed of the seed of the seed applied to one of several ignition, Total weights, of mines were as follows This 35 20 bt, TM 35 (seed) (28 bt, TM 42 20 bt, TM 43 18 bt and TM 20 bt, 25 bt, CM 18 ct, Ref 4, pp. 31 0-16.04 & cp. 92.75-70.8. Tocal weight of the mine was 20 lb, Under a load, of at least 150 kg (330.1b) the pressure plate sheared along its groove and thus came to rest on the hand of the igniter. This in turn moved down and crushed two small glass capsules in turn maved down and russhed two small glass capsules located inside the ignites body. The chipsules contained chemicals' which on mixing, produced a flash. This in turn set off the detointed and then the HE charge of the mine (Ref 4, p 81.08; 5, pp 26-9 and 6, pp 271-27).

of the since (Ref 4, p. 81.08; 3, pp 26-9-and 6, pp 271.2). Clay Mines were of two typics Anthenia, and Antiperanousia. The Antimak Mines considered of a basked clay pos 800 with a clay pressure it? Antimak Mines considered of a basked clay pos 800 with a clay pressure it? Antimak Mines considered of the top of the pot week two round bulges which housest 2.22 Az ignitures. You hillow passages leading the considered of the bottom of the main charge, such many for the considered of the bottom of the main charge, such an Fictic Acid. Presslyre on the life passed the plant artikers, etc. The Antiperconnel Clay Mine Consistent of a round clay pot 8° in Mainteen and 5° high, with a Pictic Acid was determined by meran of the explosive of Picric Acid was detonated by means of the explosive

a booster, when a pressure equal to as little as a man's weight was applied to the lid (Ref 3, pp. 38-41). Antipersonnel or Antirank Aluminum Mine was filled with Chedute (7, b) and had a TMT booster. The body and the id were of a Battened cylindrician shape. Three DZ 35 igniters together with No'8 detonators were to boostern located 120' apart inside the mann explosive charge. Pressure on the sides or in the center of lid set off one or more of the three/igniters, and the mins went off, Total weight of him was 20 lb (Ref 6, pp 275-4)

11) Light Antitank Mine, IPaMi (Leichte Panzermine), which could be converted to antipersonnel use, nor-singed of two saucer-shaped, sheet metal covers forming an O-shaped container for 5 lb of TNT and an outer cover which served as a pressure plate. Five aniters were built into the mine and spaced radial seround it. Pressure crushed the mine cover and forced one or more igniter housings thousand over that plungers.
This action compressed the outer spring, allowing the seed locking balls to be forced outward into upper recesses, releasing the atriker, ett. For converting the

mine to antipersonnel use the bottom igniter nuts were Note. According to Dr. Hans Walter, one capeute contained liquid K-Na alion and the other ethnicarrate or attric acts.

removed and the mine, resting on threaded ands of plungers was placed on a hard flat autface. Light bessence of the mine cover gebrassed the autist wine brankers are bracker one a such such anciech relite pressure on the mine cover organization of their sinks and forced the plungers upward into the ignitive housings. The mine weighted 9 lb (Ref. p. 81.05 and 6, pp 274-5) 12) Antipersonnel Mine, Glasmine 43(6, was made of glass and contained 7 or of HE such as TMT or Pictic Acid. and Contained 7 or of HE such as TMT or Pictic Acid.

The lid was a thin glass plate and served as a shear plate. When sufficient pressure was applied, the lid plate. When surricient pressure was applied, the lives broken and this action equaled the top, of the Buck igniter or tripped the actuating leves of the Schuko igniter (Hebelsinder), depending on which Schuko igniter (Hebelsinder), depending on which seems and waterpraned by device was used. The mine was made waterproof by applying a cement putry around the lid (Ref 4, p 82.06;

applying a cement purty around the interest of the 5, 50 and 6, pp 275-60 Stickmine, called 8-Stubmine, was made of woods-as's box 3½ x 6 x 10 inches, the continued a 112 blick was not specified. On top of the box was mounted a wooden support to hold a wooden the por was accusted a wooden support to hold a wooden block with an initiating strick. In the base of the block Mag.1, metal hook to which was attached a wire connected with the eye of the pall igniter 2.2 [5], locared to the cover of the bass. Movements of the strick, purious wire which set off it all contained to the strick, purious wire which set off it all cold sheekings, consisted [6].

[4] Antigeracanel indicate body attached to a wooden attick, about 1.4 [6] [6].

concrete cyminatica, pumy accorded to a wooden accel, about 1.4 long, drived into the ground. The mine contained a atendard boephole cartridge weighing 100 g and a pull igniter detohator asanghly. The concrete of the body held some pieces of the body held some pieces of the form. of the body serie asset previous when the mine exploded. A pull or pressure of 9 to 17 lb was sufficient to set of the mine (Ref 4 pp 82.02 and 6 pp 276-7)

out of minuse (rest-up) deals among pp 4:00-21.
Antipersonnel Contrem Bail Mass, which weighted about 1,2 lb, contained HE (about 1/2 lb) and an igniteration assembly. Some abrepted places were embedded in contrate. The mine could either be placed in the ground by rolled down a lill or cliff into granty troops, in the last case the igniter was pulled by hand, prior to rolling the ball, thus igniting the time

(safety) (use connected to the primary charge of the decountr (Ref 4, p 82.05 and 6, pp 277-8). Note: It seems that this nine was also called the Rollbombe

(Kolling Bomb) -16) Antipersonnel Mine, called Schutzenmine 42, abbreviated as Schumine 42, consisted of a wooden box containing a 14th demolition block together with a 22, 42 ignites a 140 occasionation between together with a \$2.6 42 ignifer and & reference on the lid pushed the pin out thus freeing the arriser. Total weight was 1.1 1b. A modified wession of Schumine used the ZZ 35 igniver (Ref 4, p.82.04 and

6, pp 278-9) 17) Antipersonnel Improvised bline (Behelfsmine W-1)
was made from captured French 50 mm mortas shell
from which the nose dute and tail fine had been removed. trom which the none suze and that the had been removed. A Buck chemical ignier and a derivation were fitted inside the cavity in the HE charge, which was either. Pieric Acid or granulated TNY weighing 4 on. A pull or pressure of one less than 35 lb was required to

or pressure of nor less than 35 to was required to set off the mine (Ref 6, p 279)

18) Antipersonnel Mine, 3-Mi 35, which might mean either Schrappellating 35 or Schutzenmine 35. The mine was also, called Bouncing Mine because prior to the ex-plosion the inner case of the mine was projected up-ward 3 to 5 feet. The British called this mine the "Fruit. Tin' because it resembled a tin can in size and shape. The mine consisted of an outer steel case and an inner canister which held about 61/2 oz of TNT or Ametal surrounded by about 350 shrapnel balls. A central arrel tube tunning axially through the mine, contained in its upper part an ignite; and in its lower part a 4½ amound delay pellet. A black powder charge for ejecting the mine, was located beneath the inner canister. Three desonator tubes were spaced radially around the inner canister, 120 spart, and a short delay element was canister, 120° apart, and a short delay element was fitted into the bottom of each tube. The mine operated by pressure or by pull. In either case, when the smiter was fired its flame ignited the 41 second delay element which in turn ignited the expelling charge. The resulting gas pressure found the inner container upward into-the air and at the same time ignited the short delay pellets in the three detonator tubes. The delay in these tubes was sufficient to permit the mine to time in the air before the deconators in the tubes were set off. The detonators then exploded the main charge and the alrapaci balls were dispersed in all directions. The effective range was 200 yards. Various antiliting devices were employed with this mine (Ref 3; 4, p 82.01

and 6, pp 280-1)
19) \$-Mine 44 was similar in design to S-Mi 35, that the S-Mi 44 used a push-pull type igniter (SMiZ 44) (which was not located in the center as in S-Mi35) and the mine detonated at a predetermined height of about 36" (Ref 6, pp 279-80).

Note: According to Ref 5, p 82.01-e there were other modifications of 5-kine and Ref 3 describes S-ki 41.

20) Elemine 42 (Flascheneismine) was an A/P Mine in

the form of a wide mouth bottle, intended for use under ice. The bottle contained 5 lb 10 oz of Gelatine-Donerit and was provided with a pall or pressure igniter. The mines were also used as antipersonnel land mines. For this they were encused in contrete containing abrapa el (Ref 6, pp 281-2)

numpuet (Ket 0, pp 281-2) Behelfnechützenmine was an improvised A/P mine in the form of a mustard pot and was loaded with powdered Picric Acid (4 og). The mine was covered by a pressed amel lid with the Buck ignitor accurbed by means of an adapter. The detonator was inserted in the center of the life charge. A moderate pressure on the top of the ignites was sufficient to set off the mine (Ref 6

pp 282-3). Abbreviations: A/F Antipersonnels A/T. Antitask, HE High Explosave.

MAN-Salu (Man-Salt) Described abidethylemine Hittate manager (Mas-Satth Described an Methylamine Mittate in the game of method for German technical anit and a p ca 103 white the puri d watering was 109110.

Ohe of the Garman methods for preparation of 4 . N-Salz was as follows: Nethylamine (97-98-5% purity) and west to hairal).

nitric acid (45 to 66%) were mixed charge maly

at the rates of 1240 and how part by actain par hour sespectively. The

1 mile

about 700 so that the heat of neutralization could be utilized at the same time for the vacuum concentration of the salt in order to avoid using too much ateam. The resulting solution of methylamine pitrate in acidic water was concentrated at about 50° to about 85% attength. The concentrated squeous liquor, which had a pH of 6.5 to 7 was cooled to 200 with water while being stirred, and the first crop of crystals collected (about 40% of the total salt). Then the solution was cooled to -10 to recover another 40% of the product. A centrifuge was used to remove the crystais. The mother liquor (about #8 87% solution of MAN-Saiz) was used to wash both batches of crystals in the centrifuge; a total of about 10% by weight of the centrifuge charge was used for a washing. Three washings were made: About 2/4 of the final mother liquor was returned to the evaporation cycle, the other 1/3 to the salt regeneration and purification. Final drying was done in stoves or by blowing hot gas through the malten salt; pH control was necessary for econom-

According to Compan sources, the heat of explosion of MAN-Salz is 1200 kcal/kg vs 1000 for TNT, the volume of sases produced at NTP (0° and 760 mm Hg) 834 1/kg vs 780 for TNT and the velocity of detonation 6600 m/sec ve 6200 for TNT, at a density not indicated The salt is practically insensitive to shock and mable even when held at temperatures ranging up to 150° In order to insure the maximum detonation rate of MAN-Salz, it is advisable to mix it with a small amount (as low as 5%) of RDX (or PETN), MAN-Salz is hygroscopic, but the hygroscopicity is reduced on the addition of Na nitrate or other substances. A mixture of MAN-Salz with Am nitrate and 15% RDX has a heat-of explosion of 1120-1260 kcal/kg.volume of games 740 1/kg and velocity of deconation 6700 m/sec It is insensitive to shock and can be cast-loaded (Ref 3).

ical recovery (Ref 1, p 22).

User: Due to the high mp of MAN-Salz, it was considered usease to 'tase'-load it into shells or bomba. This difficulty was overcome, by incorporating some Am nitrate, as for instance: MAN-Salz 25 to 30, Tri-Salz 1 to 3 and Am nitrate 67 to 74%. This mixture called Form's noftened and exuded as 60-70° and was considered not very suitable for use in shella. However, suitable mp a were obtained when ammonium bitrate was replaced by Ma nitrate, as in the following mixture: MAN-Salz 28 parts. Na nitrate 42 and RDX 13, (Ref 3). This explosive composition was practically oxygen balanced and proved to muitable must back or bullet impact, but it detomated when his by a bomb 8c shell. A similar mixture was know as C6 (see Ref 2).

In order to eliminate the danger of detonation of projectiles [Filled with MAN-Salz I in the course of shipping them to the front, it was proposed to incorporate 10-15% of water in the MAN-Salz. This amount of water was sufficient to render the MAN-Salz insensitive to shock or to sympathetic defonation, to was only necessary to add to the contents of pretties (before uses) some highly concentrated spire soliteties.

and about 15% of a highly dispersed inorganic agent, such as silica or alumina. Io order to prevent corrosion from the situte acid the inside of the projectile was coated with acid-proof paint, such as a hydrocarbon-type high polymer.

MAN-Saiz was also used in mining explosives, where it was usually mixed with Na nitrate (the cuercite melts below 50°) and a small amount of hydrated search or other gel. (to render the mixture plaste). Small quantities of RDX or PETN could be incorporated when it was desired to increase the velocity of deconation of the explosive.

2) G.Römer, Report on Explosives, PBL Rept 85,160 (1946), p 25

3) H.Walter et al, German Development in High Explosives, PB Rept 78.271 (1947), pp 4-7.

MAM-Solz Perchlores (Man-Solz Perchlores), Methyliammonium prechlores) was peped by Water et al by enumerium genomonethylamine with perchloric acid. As this explosive had a high mp and was highly sensitive to shock, it was necessary to use it in matoures with substances which would lower its sensitivity in well as its mp. The low mp was desirable in order to be able to cast-load the explosive. Such mixtures could be obtained by boiling under treflux, a solution of Am perchlorese in commercial queous formalabhyde. After distilling off the water and other volatiles, a solid explosive, mp 90-100°, was obtained. It was compacible with RDX. As it was inferior to MAN-Salz, no further investigation, was made [ Water, PB Rept 78, 277 (1947), p. 7 B Rept 78, 277 (1947), p. 7 Begt 78, 277 (1947), p. 7 B

Marine Explosives of WW 7 and WW II. Under this title A.Stettbacher, in Protar (Switzerland) 9, 33-45 (1945). describes the explosives used by the Germans for filling torpedoes, ses mines, depth charges etc:

al Emplosive of WW I: TNT 60, HNDPhA (heisanitrodiphenylamine) 40%

b) Explosive of WW. II: TNT 61.8, HNDPhA 23 and Al powder 15.3%

The second mixture was much more effective than the first one.

Révises Geschért Pulven Black poyeder und as hunter is photofinsh bombs, such as Street Posses. The consense of the property of the property of the property of the hances 1,5%. The granulation wise 0,68 to 1,3 mm and the molatuhe content 1,5%. Réferènce: The 9-199-2 (1953), p. 82.

Merk 50 Keshede (Cascade Flare Bomb). See under Pyrotechnic Anti-Pathfinder Devices,

Merker (Anzerger). A pyrozechnic device used to mark a position. Most of the German markers consisted of cylindrical gardboard containers filled with a colored flare composition garmoned containers tilled with a colored time composition which was ignited by an impact, type fuse. Some markets merely contained a brightly colored powder, which was dropped into the sea from low elitimdes to mark positions. Others were modified paracture flares of various colored in the colored powder.

- The following natural described to TM 2-1292-2 (1293)...

could be classified as markers;

1) NC 50 WC NC D/SEE, Smoke Marker Bomb resembled
as ordinary HE bomb, it consisted of so, aluminum puter casing (empty except for metal ribs and braces) tail, cone, some and central cylinder which protested from the some and extended aft to the forward part of the tail where it was perminated by a fuse housing crimped to it. Waterproofing at the tail was provided by a rubber seal. The central cylinder contained the smoke producing agent. Four fins and a place (called drogue) west arrached to the tail end. Impact of the bomb on water caused the drogue, together with the fuxe release red, to be wrenched off. This action fired the fuxe and imited the amoke mixture. At this time the bomb would be floating on the surface. Eventually the heat; from the burning amoke composition destroyed the rubber seel and the moke was vented to the outside, thus indicating the position of the marker (pp 58-9)

2) Mark S Fince, Types I and 2, Floating devices which could serve as markets of for signalling purposes (See mader Flare and in TM 9-1987-2, pp 7-9).

3) Target Indicator (Red) consisted of an aluminum cylindrical casing housing a flare composition anclosed in a cardboard cylinder. The suspension plate at the held an eye to take the parachute shackle, and pall igniter which was connected by \$ 4% inch length of safety fuse to a small bag cones black powder. This served both to set off the igniter pellet in the the candle and to eject the latter from the castn. when it fell freely to earth and acted as a ground marker. The pull igniter was attached to the loop of the shroad lines by a cord and the opening of the parachute gave the necessary pull for operating the inniter. There, were (for some unknown purpose) two small line at the nose end of the container (pp 84-5) 4) Ses Marker Bomb consisted of sheet steel, bomb-shaped container, supported internally by a series of annulat attengthening bulkbends. The tail and of the somb was provided with four stabilizing time and in extension bousing a lame unit covered with a lucite dome. A battery of six dry cells was boused in the center of the bomb. As the momens of the release of the bomb from the aircraft, the inertin bolt was positioned between the plates of the spring switch in such a manner that one-side of the circuit between the lamp and the batteries was broken. On impact of the bomb, the meetin bole was forced out of position and the circuit between the lamp and battery was completed. As the batteries filled only a portion of the bomb body and as all joints" ver. made tight by tubber washers, the marker floated on the surface of water. It is assumed that the

marker provided a recognition or bearing point for

aircraft.(pp 85-6) 5) Sea Marker LUX EZ 50 SC was constructed of sheet steel in two parts (nose and tail) loosely joined together about 1/3-the distance from the nose. Its external view and a brief deacription are given on p 87 of TM

9-1985-2 (1953) 6) Mark 3 Grun (Single Unit Ground Marker, Green) consisted of a sheet steel cylinder enclosing a cardcussisten os a somet signi cylingue; enclosing: a card-hoard consisten with the pyrotections composition, a fuze with gaine (filled with black powder), an arming-spindle and an aming vane, which was loosely fisted, within the housing. On release of the marker from the aircraft, the current of air rushed through? the was: holes in the arming yone, thus ejecting it from the housing. By reason of its shape, the aming wase totated as the missile was fallings. This courses unscrewed the aiming spindle of the furnishes permitting its clockwork mechanism to function. At the expitation of predetermined delay, the black powder in the raine became ignited. The Tenulting flash ignited the pyrotechnic composition and at the same time a slight explosion took place which ejected the cover cop, suze and arming want housing. The pyrotechnic filling burned for about 314 minutes -

2) Luz N Flame Float. A bomb-like device constructed of affect steel and provided with four fins. When released over water the device went undetache surface thus allowing the water to enter the ports and to pass down the injet tube into the calcium phosphide chambers. The resulting reaction produced phosphine gas which to the burner where it ignited spoutaneously to form a pilor jet. At the same time, water entered through the channels in the nose and passed through a perforsted tube into the calcium cathide compartment. The acetylene evolved passed through the perforated disphragm into one compression chamber and thence to the burner where it was-ignited, by the pilot jet (pp 91-2) 8) Lux S Flame Float (Types 1, 2 and 3) was cylindrical

in shape and contained, as in the previous device, Ca phosphide and Ca carbide (pp 92-3).

Marspille or Mars Priming Drops. Low tension fuseheads intended for ordinary instantaneous detonators. They were manufactured by dipping the tip of the electric bridge wire into the following liquids:

a) Lat dip composition consisted of 100 g of dry Ph bicrate suspended in 50 ml of a 2% solution of NC in amed or buty scetate. After the drop on the tip became, dry it was dipped into

b) 2nd dip composition consisting of Pb picrate 40 a. Kiperchlorate 35 g and alderwood charcoal 25 a. sunperided in 50 ml of a 2% solution of NC in amyl or bury!

c) 3rd dip composition contained & perchlorate 85.7 and alderwood charcost-14.3 g, suspended in about 50 ml of a 3% solution of NC in amyl or buyl acetate d) 4th dip composition was a lacquer consisting of a 15% solution of NC in 75/25 butyl acetate ethanol to which was added (20% of the dry weight of NC) Sipolin AOM. and 17 g of Sudan Brown for each 10 I of liquid Notes: A) For meterial to be used in tropical countries, the 4th did contained Al powder (200 g per liter of

lacquery, which was supposed to protect the fusehead aminur static electricity B) Mars Tile powersand the property of not igniting

which was a great advantage. C) The soldering of the budge wire to lend-in wires, the preparation of dry ingredients, for fusehead dips, the preparation of NC varn; shes and the process of dipping the fuschesds are Cescribed under Faschend Manufacture.

notating by reason to us analyse, one among water totated as the missale was relained. This totation was revered the among spindle of the first flux plottering the receivant of predetermined to the client. As the explanation of predetermined to the client to the composition of the client to the professional composition and as the same time a slight explosion, took place which ejected the cover cap, suse and among frame housing. The pyrosechaic filling barned for about 3½ minutes.

2. Lus N Flame Float. A bomb-like device constructed

of wheat seed and provided with four fins. When released over water the device went undexactle surface that allowing the water to enter the obta and to pass down the surface that allowing the water to enter the obta and to pass down the surface that the surface thad the surface that the surface that the surface that the surface

B) Lux S Flame Float (Types 1, 2 and 3) was cylindrical
in shape and contained, as in the previous device, Ca
phosphide and Ca carbide (pp 92-3).

Muspille or Mors Priming Drops. Low tension fuscheads intended for ordinary instantaneous deconstors. They were manufactured by dipping the up of the electric bridge wire into the following liquids:

a) let dip composition constated of 100 g of dry Pb picrate auspended in 50 ml of a 27 solution of NC in any my to butyl acetate. After the drop on the rip became dry it was diposed into

b) 2nd dip composition consisting of Pb picrate 40 s.

Lipsycontorate 35 g and siderwood charcoal 25 g, augmention of NC in amyl or buryl mage date.

"Tyd dip composition contained K perchlorate 83,7 and siderwood charges 14,3 g, suspended in about 30 ml of a 3" solution of NC in amplior buryl acetate dy-4th dip composition was a lacquer consisting of a 13" solution of NC in 3"3",5 buryl accetace channol to which was soded (20% of the Jry weight of NC) Sippoin AOM inchical in the metalyticolnexial ester of adopte acid. Two 1" g of Sudan Brown for each 10 1 of liquid. Notes: A) For materia. In one used in topoccal countries.

the 4th dip contained Ai powder (200 g per licerof inequer), which was supposed to protect the fuse-read against scatic electricity.

it) Marshille possessed the property of not igniting friedemp, which was a great advantage

C) The soldering of the bridge, were to lead-in wires, the preparation of dry ingredients for fugahead Jips, the preparation of NC same sheet and the process of dipping the lastnesds are described under fuserness Manufacture. 1) BIOS Final Rept No 833, Item 2(1946), p A3/36 2) PB Rept No 95,613 (1947), Section D.

Manchinengewehr (Muchine Gun) See under Wespons.

"Move" i Mouse!. A heavy mark designed by Porsche (See Experimental Tanks, under Panzer)

Monanti (Meganite) One of the Wh I straight dynamics. NG 60.0, Brusted wood pulp 10.0, nitrated ivory nut neal (coron) 10.0 and Na nitrate 20.0% [P.Nabum,Nitroglycetin, Baltimore (1928), p 284.

Mehipulver (heal Powder). Afterly pulvenzed black powder used in pyrotechnic compositions. Its preparation is deribed by A.Stecthacher, Schriss- und Sprengstoffer, 'Leipzig (1933), p 103 (See also Meal, Powder in, the general section).

Matim. A jetly originally depared by Sprengarolfe A-Carbonit, Schlebauch, by allog glycerin with an aqueous solution of glore, it was incorporated in 30me dynamics in order to increase theisighlasticity, Some glycerington wintsures contained dethin (See also Gelatine-Carbonit and Safary Jetly Dynamics).

Reference: P. Naoum, Nitroglycerin, Baltimere (1928), p 406.

Meldebuchee (Message Container or Message Tube), A device for dropping messages. Two types of containers med for this purpose are described in TM 9-1985-2 (1953), pp 120-1:

a) See Meanage Tube consusted of an alumnum cylinder in which the upper compartment consumed a smole composition, whereas the lower (arright) comparement and place, the friction ignires, was pulled and the resulting bottom part of the smoke composition, when persons for whom the meanage was intended, saw the smoke, they approached the misalle and removed the meanage was presented the misalle and removed the meanage was intended, saw the smoke, they approached the misalle and removed the meanage compared to the cube and pulling the chair (o 120).

b) Lead Message Tube was also cylindrical in shape and consisted of two copporationats. The smoke Componition in the upper compartment was ignited by means asked of the smoke reconsistent and net stevenal pieces of quickmatch below the zimoke container. The attends were ignited when the first coin signific was pulled on dropping the mastife from a place. The message was (or 121).

Mercurie Fulminote . See Knallqueckeilber.

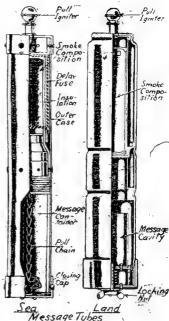

Neasuga Platel Grenade (Nachrichten Pigtolengranate).

Mansage Tube. See Meldebüchse

Meaned (Meanuring, Egg.). A device designed at the Knipp plant for neasuring the pressure developed in guas. The extent to which a copper cylinder was compressed by the gases of combustion of a propellant served as a measure of the maximum pressure developed in chamber. For more information on this subject, see H.Brunswig, Dan rauchlose Pulver, Bettil (1956), p. 412.

Meracelludol Frade name for m-Toluneasuffemide, H<sub>2</sub>C.C.<sub>6</sub>H<sub>A</sub>SO<sub>2</sub>NH<sub>Z</sub>, white crystals, no p. 107°. Its solution in some organic media was claimed to be a good gelatinizer for MC.

Reference: Kant-Herz, Chemische Untersuchung, Braunschweig (1944), p 162.

Methylomine. Ice preparation and properties are given in the general section. According to Dr. H. Walter, methylamias was never used in Germany per se but in the form of ice mirrate, called Man-salz (27).

Methylumine Nitrate See Man-Salz.

Mathylnitroproponedlal Dinitrate,

described in the general acction, was examined in Germany during WW II as a possible substitute for NG in propellants. It was found to be fairly stable but not a very good gelatinizes for NG.

## DICTIONARY OF EXPLOSIVES, AMMUNITION AND WEAPONS

(GERMAN SECTION)

BASIL T. FÉDOROFF

HENRY A. AARONSON GEORGE D. CLIFT EARL F. REESE

DOVER, NEW JERSEY

Methylsteff. A mixture of aluminum dichloromethyl, AlCi\_CH\_1, and aluminum chlorodimethyl, AlCi(CH\_1), proposed as a substitute for phosphorus in incendiary aitions. The mixture was prepared by passing methy chloride vapor through copper-iree aluminum turnings.
Réference: R.E.Richardson et al. CIOS 25-18 (1945).

Matrialtrinitres (Metric) Trinitrate), (Methyltrimethylolmethene Trinitrate or Pentaglycorin Trinitrate), H.C.C. (CH\_ONO\_), described in the general section, was developed in Italy before WW II by Bombrini Parodi-Delfino

and adopted large by the Germans.

The following method of preparation was used at the Krimmel Fabrih of D A -G : .

a) 50 kg of finely pulverized and nieved Metriol was slowly led with stirring by neans of a worm screw, ince a expinious steel nitrator containing 175 kg of mixed scid, (65% HNO and 55% HSO.) maintained at 20 . Formation of lumps and to be avoided because

this could lead to overheating und decomposition of metrial and acid

b) After 20 minutes of nigration, 15 minutes were allowed for apparation of the oil from the acid

c) The separated oil was washed, first with water. then with sods ash sols and finally with water. The temperature during all the washings was maintained at 40° because at a low temp the mirrore was too viscous. The sods ash wash lasted for 20 minutes.

The wield was 200 parts MtrT per 100 p of Mr. d) The washed oil was taken to a storage, tank from

which it was withdrawn when needed for the porneration of "Rohpulvermased (Rawpaste) (q v ). German technical MarTwas a beavy oil, practically insell

in water, with the following properties: No.16.00% to 16.32%, d 1.460 at 20°, stability by Abel test at 82° 20 mins, decomposition temperature ca 1.82°, impact sensitivity with a 2 kg hammer 4 cm- culorific value 1270 kcal/kg (water in limid phase), volatility less than NG.

It was used in some amokeless propellesce as an enplacine planticines for NC in lies of NG.

Reference: PB Rept 925 (1945), pp 15 & 61.

Michalankit (Michainskies). A type of chlomas explosives manufactured in Germany and Poland before WW II: a) E or - Na chlorare 88-91 and liquid, hydrocarbons (with flush point not below 30°C) 12-9% (Ref 1); b) K chlorate 90 and petroleum 10%, the first mixture belonged to the group of Chloratites 3.

#### Mine, Land. See Landminen;

Minenhund/Mine Dog), called by the Allies "Doodlebug" or "Goliath", was a miniature two-track tank operated by remote control through a 550 vd 1 atrand cable which uswound from a drum on the tankerte. Separate electric motors. each powered by its own storage battery, drove the two each powered by its own storage battery, grove the two tracks of the twok at a speed up to 4 sph, Steering was done by braking the tracks. The tank countined about 250 kg HE demolition charge which the remote-control operator was supposed to touch off after stopping the vehicle at its target.

These mobile mines were not very effective because they could not more in severae. On account of their low speed and thin amour, they were easily destroyed by the Alites' artillery.

Miselam and Miselam Seeling Pluga. Mipolame are plantic compositions developed in Germany during WW II and used in the prepa of scale for some delay detonations. Previous to WV If frad seals were used. The Minolan sealing place were made in three types:

a) Long greyish-green plug with a single hole

b) Short grayish-green plug with two holes. The Mipolam was composed of polyvinyl chlorids 50, tricresyl phosphase 30 and reicum 20%

c)-Shore reddish plug with two boles, The Mipulum was compound of polyvinyl chloride 51. Special Mixture 51. and talcum 1876 as Note: The Special Mixture consisted of 2 parts microsyl

phosphare 2 pre Palatinol HC and 2 pre Palatinol K. The composition of Palatinol HC was not given, and the Palatinol K was butylene glycolobthalace.

Mipolam was also used for covering the land-in wires of electric deconators. The thickness of coating for 60 cm wires was only 0.25 mm on deconstors not intended for underwater operations and 0.35 mm on those intended for such operations.

Myrol (Myrol). A liquid explosive consisting of a solution , of methyl nitrate in methanol or other solvents. The term Mysol was also used to designate straight mothyl nitrate. The material puppl prior to WW H (by cautiously dropping grow materials proper for war at (no cautiously dropping acclused into a miture of circin and sulfactic cald) proved to be impure, materially in storage and very sensitive to heart and chocks. During Well, Walters et al. (Ref. 2), developed a continuous method of manufacture, of methyl circumstems of method and distree from methods and distree information and distree from methods and distree information. more stable product than that prepe previously. A derniled description of the method of preparation is given in Ref 2, pp 9-10. Pure methyl nitrate proved to be an emplosive more powerful than NG, with a bringer exceeding any other high explosive known and with a sensitivity to shock comparable to that of PEIN. Pure methyl nitrate in a clear mobile liquid with a ba of about 63° (145°E) and is insoluble in water.

Insanuch as methyl airrate is very sensitive to mechanical action, it was found much safer to use it is solution in methanol. Such aclusions, called Myrol may be elected directly in the process of manufacture of methyl nitrate, all that is necessary is to use an excess of methanol. One of the most suitable solus proved to be the ascotropic minture consisting of about 75% methyl nitrate and 25% methagol, This mixture has a b p of 57,5

Mysols comes at loast 25% mathesoi will not evaparate t leave hazardone 100% methyl nitrate.

Notes Romes (Ref 1) walls Myrol, the mixture consisting of 19% methyl nitrate and 27% of technical methanol containing 63.4 H.O Tschinkel (Ref 5) says that Myrol consisted of 80 weight percent methyl nitrate and 20 weight percent

following are some properties of methyl astrace-methanol mintages: velocities of detonation ranging from 2400-4900 to 7500-8200 m/sec, volume of mans about 873 1/kg, hear of explosion 1640-1700 heal/kg, power and brisance-comparable to those of NG, sensitivity to shock-comparable to that of DNB, and toxicity-comparable to that of aliphatic

aitzates, such as NG and PETN. Like NG Myrol causes headaches and pulse excitation, but they disappear more rapidly than with NG. Caffein or coffee proved most successful in decreasing pulse excitation.

References: See under Myrol Explosives.

Myral Explosives. Mothyl aiteste and its mixtures with mechanol, beneure, airrobenteure, etc found extrasive application during WB Its signedienth of numerous liquid plastic, and solid propellants and explosives. Some of these mixtures were known as Erantasprengatoffe (aubactitute autolosives).

In the case of liquid explories or propellants, Myrol (northyl nirrate plus methanol) was used either by irestling or in mixtures with other liquids, such as bename; MNB etc. In some cases methanol was replaced completely by benkens, MNB etc. In the case of plastic explosives of propellants, Myrol was methanol was replaced completely for foom a soft (elly. In treated wich small amounts of MC to foom a soft (elly. In the case of solid explosives or propellants, Myrol was treated with a large amount (25-10%) of MC. m-foom-had eithy, or was mixtured with the usual folid impredients of dynamics; such as kitcell githe, insedunct (no exactic nitrosts, lizzin, etc.)

Due to the fact that Myrol is a volatile liquid, all mirrores contg it had to be kept in air-cight containers.

mirrores cong it had to be kept in air-ciphi containers. Several Mycol manufacturing plains, were built in Germany during the 2nd half of XV II and the total capacity was as high Brail 2000 metric total per conght. The largest of these plants was the Cartestary MC Total Constitution of the Constitution of

- hyrol explosives were used for the following purposes: I cliqued Myrol mixtures were used as rocket propellands, as charges for baggalore torpedows, land niness, bossessia future and for, cleaning our tretches, fortholes; tet 2) Plastic Myrol mixtures were used as military decolition
- charges and mining explosives

  3) Solid blyrol explosives were used as bursting charges in
  land mines, 50 kg projector mine, hand greundes, warheads
  of rockets V-1 and V-2, the bursting charge of Panzerfaust
  (AT thaped charge), bossers see.

More detailed information on Myrol Explosives and their uses follow:

- A) Liquid Myrol explosives could be used for military or comercial blassing-operations. When cited for descroping enemy installations, rocks, etc., Myrol could be pdured directly into holes or ginches, then avoiding being of follows. If no holes or crucks were present, they bould be usuify preduced, by wholesing small denseligion charges (such as in tis case or boxes) directly on the surface of a pock, courtest see. When found from underground was, liquid Myrol could be placed in several boxes connected by pipes (also tilled with Myrol) and lone and of the train detonated B) Liquid Myrol suplosives were found to be autisable for was to be parties topopoles.
- C) Liquid Myrol mirmar, such as methyl nicase. 75-80 and archanol 70-25% was considered to be suifatecopy as a figuid roctor forl. Since the case of propagation in this riquid is alow, there seems so danger that the combustion come might run back from the cimbustion chamber to the supply tank. It was found that this nixture could not be supply tank. It was found that this nixture could not be supply tank.

D) Liquid Myrol han found to be suitable for clearing our enemy trenches, foundhout, woods, etc. This clearing our operation was necessary obsertions to order to dearny mines, by other explosive or toxic devices left by the enemy. The following ingenious method, using Myrol in the form of woor, was developed by the Germans:

A home provided with two fuzes, filled with Myrol and cong a small box with liquid carbon diomid was dropped from a plane on the rargle. The impact of the bonds caused the first fame to jurse the box with CO, and to break the homb. This caused the vaporization and distribution of the Myrol shroughout the treach (or forbale) without giping or exploding it. The becond fuze (time fuse) caused the deconation of the explosing entirest consigning of Myrol i and Aurosphetic, oxygen. With sufficiently strong initiation the following reaction has been populated:

2CH ONO + 40 = 2CO + 3H O+N

When using this bomb in cold wenther, the vapor pressure of the mixture can be increased by incorporating a small amount of methyl nitrity, CH, ONO

E) Liquid Myrol, or straight methyl (or ethyl) sitmer, was used in the following device developed by Standinger:

Two small glane anopoules (kalba), noe filled with methyl sinkine (or-with beav bealing both) antened, and the other, with metallic nodium were flaced inside a fuse close to an 18 filler of a load mine, but separated from it, by a this above of plantic parenial. On top-of the bulbs was placed a glass supper, Pressure on the stooper caused crushing of the bulbs. This was followed by an explosive "Mexicioe hereon notify for earth) ninne, and sodium. An

a result of this the sheet of plantic was pieceed and the explosive charge issued the mine or bomb desponsed. Based on this principle, several land mines were developed. The smallest and simplest land mine consisted of a flask containing 80-90 a of Myrol. Through the neck of the flash was inserted a test tube reaching nearly to the bottom of the flank. An ampoule containing metallic sodium was placed in the test tube and on top of it a long plunger was carefully inserted. The pressure of this plunger caused breskage of the ampoule in the test tube thus brinking sodium in obstact with the Myrol. This action caused the detonation of the Myrol in the flask. The efficiency of these small mines was sufficient to disable a moror rehicle suc. Larger mines consumed of rectangular above iros house filled with 'We of 88/12-Methyl nitrate/MNB mixture and used the Myrolandium fure

F) Liquid Myrol employers were also used to increase this percentage delete of shaped charges, such as of 40/60-TNT/ROX "explosive. For this, a tental glass ampoule (bulb) filled with 90/10-46/rivyl nitrock/MMB mixture was, placed in the sir space (stand-off space) between the concluse surfaces of the shaped charge and the object to be pieceed, such as smoot, concrete, etc. For maximum effect the spiritance (fixely should be placed at the end of charge ferdient, from the traget and pointing contacts, if. For image, in shaped charge corpeione, initiation of the explosive should be accrete from the tail end and not from the more as it is done in occiniary correction.

G) Soft jellind enplosaves could be obtained by incorporating 3 to 37st jellind enplosaves as for instance, the cose constanting 1898. There jellies could be also instance with polyected solids, such as sodium nitrate and/or coit provder, thus obstaining solid explosives. The solid mittures were found suitable for filling the 30 kg projection mittage were found suitable for filling the 30 kg projection miner. These mines exercised autors him without

h) Haud jullied propellants could be prefid by incorporating in liquid abyrol (such as the lones conta 7:5-80% of methyl nizmus and 20-25% of methyl nizmus and 20-25% of methyl large 'amounts (23-30%) of nitrocelluloss. Such mixturus formed very uniform hand colloids subtout poses or creake and for this maxon, were lound to pe sustable as similar cocker propellants: if it is believed that some of these mixtures were used sowad the end of \$M\$, II as a liquid for VI-1 and VI-2 reclaims.

Because of high volatility of Myrol, the propellent sticks used in rockers had to be coated with a special

material impermeable to Myrol

1) A hard relited explosive prepd by gelatinizing NC with
a mixture of 91-95% methyl attract and 5-9% of MNB, was
used in some hoosters.

3) A solid, highly breant, explosive consisting of 30 to 40% of 73/2) April since with such amounts of hydrated. Ca nitrate and ligain that the oxygen balance was equal approximately to zero. The mixture was found suitable for Hilling bombs and land mines

s) The high brisance and fairly high sensitivity to shock of the last mixture was presumed to be due to the fact that Ca situate extracted and bound some methanol of the minutes, thus leaving part of methyl nitrate as free assistive droniers. Another explanation of free methyl nitrate was partial evaporation of methanol, which is more volatile then methy | nitrate-According to Dr H. Walt er, Myrola vaporine in the form of amostropic mixtures come about 25% methans b) In order to prevent an excessive liberation of free methys nigrate, it was broposed to use a nolvent less volutile thes methanol such as bensene or nitrobenseny, in order to prepare such a minture, the regular Myzol, which is a mixture of 75% methyl pitrate and 25% methanol, was shakes with bearens or MNB is presence of some water. This caused the methanol to go into the aqueous layer, while methyl oitrate remained mixed with benzene by MNB. E) A solid explosive contg 30% of a mixture consisting of 90 pares of methyl nitrate and 10 pts of bennese, plus 55% of hydrated Ca aitrate, 10% of finely pilverized aluminum and 1% of pulverized peat, had an oxygen balance equal approximately to zero. It was highly-bringst and powerful, although its nitrogen content men much lower than that of THT (14.2% vs 48.5% for TNT), This mixture was proposed as a littler for warbonds in rockets V-1 and V-2

Note: Microse of sectyl aistase 903 min beanes 10%, do not caderay any simplificant change in composition to anomaly of the composition of the composition of layrol mixtures may be easily and repidly determined by checking it "structure locks: L3 A solid Myrol explosive consisting of 85/15-Methyl airmst/MDS geltainingd with NC seed mared with sawdust and hydrated Cr sitress, was suitable for use in hand greadess of an mining.

<sup>9</sup>M1) A solid briman explosive consisting of Myrol and a pulverized mixture of K nighter, aluminum, and pest was swindle for hand greander, land mixes, and rock blasting. "References:

D) Liquid Myrol was found to be suitable for clearing our enemy trenches, loubolts, woods, etc. This cleaning out-operation was necessary amountmen in order to destroy mines, or other explosive or totic devices left by the enemy. The following ingenious method, using Myrol in the form of yapon, was developed by the German:

A bomb provided with two fuses, filled with Myrol and cong a small how with liquid carbon district was dropped from a plane on the targle. The impact of the bomb caused the litts fuse my burst the bow with CO, and to break the bomb. This returned the vaporization and distribution of the Myrol throughout the trench (or fothole) without igniting or exploding is. The second fuse (time fuse) caused the Secondino of the explosive mature consisting of they and assumptions of the explosive mature consisting of they of the constraints of the constraints.

2CH .ONO + 40 = 2CO +3H O+N

Then using this bomb is cold weather, the vapor pressure of the mixture can be increased by incorporating a small amount of methyl nitrite, CH ONO E) Liquid Myrol, or straight methyl (or schyl) nitrite was

L) Liquid Myrot, or straight metays (or stray) nature, was used in the following device developed by Standinger:

Two small sians ampoules (bulbs), one filled with methyl nitrate (or with less volatile sthyl nitrate); and the other with metallic sodium were flaced isside a fuze close to so HE filler of a land mine, but separated from it by a thin sheet of plastic material. On top of the bulbs was placed a class stopper. Pressure on the scopper caused crushing of the bulbs. This was followed by an explosive Peaction between methyl (or ethyl) nitrate and sodium As a result of this the sheet of plastic was pierced and the explosive charge inside the mine or bomb decounted. Based on this principle, several land mines were developed. The smallest and simplest lead mine consisted of a flack conthining 80-90 g of Myrol. Through the neck of the flank was inserted a cost tube reaching nearly to the bottom of the liable. An empoule containing metallic sodium was placed in the test tube and on top of it a long plunger was carefully inserted. The pressure of this plunger caused breakage of the ampaule in the test tube thus bringing sodium is contact with the levrol. This action caused the deconation of the Myrol is the flask. The efficiency of these small mines was sufficient to disable a motor vehicle atc. Larger mines consisted of rectangular sheet-from boxes filled with No of 88/12-Methyl nitrace/MNB mixture and used the Myrolsodium faze

F) Usuald Myrol explasives were also used to increase the posteroid grider of shaped charges, well as of 400,000 TNT/RDX "explasive. For this, a small giass improve (culb) filted with 90/10-866/yi mismax/MDM misruse was placed in the six space (stund-oid space) between the concluse surface of the shaped charge and the object to be pierced, such as amost, concrete, see, For maximum effect the igistator (stund-oil space) and produce the end of charge institutes, from the target and pointing towards it. For instance, in shaped charge topochese, including one and the object and the end of charge institutes, from the target and pointing towards it. For instance, in shaped charge topochese, including one of the explosive should be started from the target and page of the product of the down to the product of the

G) Soft jellied explosures could be obtained by incorporating, J to 3% of NC in any of the Myrol explosures, as for instance, the mass containing NMB. These pellies could be also mixed with pulverized solids, such as godum nitruse and/or componder, thus optaming solid explosures. The solid mixtures were found suitable for filling the 50 kg projector mines. These mines yeared a strong latest effects. ii) Hand jeillied propellines could be prople by incorposating, in liquid hypot (such as the base count 37-80% of another jein liquid hypot (such as the base count 37-80% of another jein large annuant (23-10%) of anteroclibulous, Such manager formed very uniform hard collored without poses or cracks and far fight reason, were found to be ministed as failed rocket properliments. J) A rolld, highly britant, explosive consisting of 30 to 40% of 75/25 leptol sized with such amounts of hydrated , Cn sixture and light that the oxyget halence was equal approximately to zero. The mixture was found suitable for Hilling humbs and lead onines

notes:
a) The high brisnace and fairly high sensitivity to shock of the last mixture was presumed to be due to the fact that Co situate entracted and bound some methinol of the minmer, thus leaving part of methyl sittate as feed agastive droplets. Another explanation of free methyl nitrate was partial evaporation of methanol, which is more volatile then methyl nitrate. According to De H. Walens, Myrols vapori as in the facet of apportunic mustures many about 25% methanol b) in order to prevent an excessive liberation of free methy aitmen, it was proposed to use a solvest less volatil then methanol such as because or nirrobectors. In order to proper such a minute, the regular dived, which in a migrace of 75% methyl signate and 25% methanol, was shaken with beakens, or MNS is presedely of some water. This caused the methanol to so into the account laver, while methyl aimste remained mixed with beasens be MNB K) A solid explosive coneg 30% of a minture consisting of 40 sures of methyl nicrote and 10 per of bennene, plus 55% of hydrated Ca nitrate, 16% of linely pulverized aluminum and 5% of pulverised peas had an oxygen balance equal approximately to zero. It was highly-brisant and powerful, although its nittogen contrat was much lower than that of TNT (14.2% we 18.5% for TNT). This mixture was proposed so a filler for warhends in rockets V-1 and V-2

Nipolit. Nipoliter A type of NC-DEGDN-PETN propellant or ex-ploatre, developed during WW II at the Kraiburg plant of the Deutache Sprengchemie GmbH. The following com-positions are listed in Refs 2, 3 & 4 (See Table 27s.)

Composition (%) and dimensions	Nipelit tubes	Mipolit Sticks				
NC(12.6-F2.7% N) DEGDN 4 PETN (unwaxed) Stabilizer MgO Graphite	34.1 30.0 35.0 0.75 0.05 0.1	29.1 20.0 50.0 0.75 0.05 0.1				
Length of grain Diumeter of grain Hole Diameter Hole Depth Veight of grain Calonfic value, cal/g	80 mm 27 mm 9,1 mm 30 mm 42 g 1300	50 mm 9.1 mm				

Note: MgO was added to neutralize soid developed or decomposition, and graphite was added to prevent the

accumulation of bazardous static electrical charges, For the preparation of Nipolit, a water alury of NC was air-aginated in a lead-lined vessel, with the desired amount of DEGDN. After 15-20 manutes stirring the mass was centrifuged to remove all but about 75% of water and the resulting cake was kneeded, at about 30°C, is a Weiner-Pleiderer machine with the calculated amount of pulverized PETN, some water, ambilizer, MgO and graphies. After about 15 minutes of theading the mass (passe) was trans-ferred to cubber lined bags where it was allowed to age for 48-77 Kouse.

a) According to Ref 4, all raw materials with the exception of PETN were added in the paste mixing stage, while PETN was added during incorporation

b) It was claimed that the aging process insured better gelacinization and reduced the bindency to fire during the

rolling operation which followed c) The calorific value of the materials was carefully adjusted to between 450 and -10 calories an penniscible variation from specification value for the propellate being processed. If the thousand the calorific value for the propellate to the processed of the p

Rolling and grapulation were carried out an follows: About 18 kg of the aged paste was passed, about 19-20 times, through a past of vertical rolls maintained at 90-100 (Ref 3).

Note: According to Ref 4 rolling was conducted at temperature not higher than 75 C.

The resulting sheet (moisture content about 3%), was made by hand into a carpet roll and transferred to the press-house where it was kept in a steam heated oven prior to transfer to the extrusion press. Then the mass was extruded at a pressure of 200 kg/cm and at a rempersure of about 80° and, the resulting tubes (or aticks) into desired lengths.

After drying the cut material for about 24 hours at 40-50°, the moisture content was reduced to about 1%.

The next operation consisted of wetting each stick Nipolit with accrone and pushing the arick into a nube Nipolit flush with one end. This left a cavity 30 mm long in each tube to accomminte a detonator. The stick

Mitrie Acid (Salpeternaure). Its preparation, properties and uses are described in the general section. Nitric ecid was produced in Germany during WW II, mostly by the ammonia exidation process, in quantities exceeding 140,000 tons per year. In addition, there was also available the 17,000 tone produced in occupied Austria, Czechoslovakia and Poland.

For the manufacture of highly concentrated (hoch-konzentzierte) uittac acid, the so-called "Hoko"  $(q \ v)$ process was developed.

Production of nitric acid in Germany was controlled by the Stickstoff-Syndikat.

Following is a partial list of the principal producers of matric acid in the Septem Zone of Germany:

a) Badische Analus- und Sodafabrik A -G, Oppau

(formerly IG Farbenind A -G) b) Bergwerkgenellachaft Hibernia, A -G, Herne, Stickstoffwerke, Wanne-Eickel

PETN, some water, smalliser, MgO and graphite. After about 15 minutes of kneeding the mane (paste) was transferred to rubber lined bags where it was allowed to age for 48-72 hours. Notes:

Notes:

a) According to Ref 4, all raw materials with the exception
of PETN were added in the paste mixing stage, while
PETN was added design incorporation
b) it was claimed that the aging process inswed by-tree
plantingston and reduced the indexery so fire during the

gelatinization and ordered the indexery to (ine during the colling operation which followed in a territal was carefully colling operations which followed in a calcinities as permitted bit expressed to the other colling and the collines as permitted by processed. If outside these limits, the material was re-turned to the sincers and the calcuffic value either reduced by adding centralities of hydrocullulone or increased by adding the colling of the calcuffic value of the colling and the colling of the calculation of the colling of the diding were paster consisting of NG and DEGDM. Each mixer was anapled as least every 8 hours. For a total charge of 18 kg a maximum of 3 kg of records material was Rolling and granulation were carried out as follows:

About 18 kg of the aged pasts was passed, about 15-20, times, through a past of vertical rolls maintained at 90-100 (Ref 3).

Nipolit (core) acted as a booster.

Note: According to Ref 4 rolling was conducted at a temperature not higher than 75 C. The resulting shest (societies content about 3%), was made by hand into a carpet roll and transferred to the made by hand into a carpet foll and management to the prise-house where it was kept in a attent heated over, princt to innester to the Extrusion press. Then the mass-was servided at a pressure of 200 kg/cm and at a tempera-ture of about 80° and the resulting tubes (or scicks) fast

into desired lengths. After drying the cut material for about 24 hours at 50°, the moisture content was reduced to about 1%. The next operation consisted of wetting each stick Nipolit with accrone and pushing the stick into a tube Nipolit flush with one end. This left, a carrier 30 mm long in each tube to accomposate a detonator. The stick

Nitrocallulose, Nitrocallulose oder Schlessboumwalle abbreviated in German to Nz (Nitrocellulose, abbreviated in this work to NC). See general section under Cellulose. Due to the absence of native cotton in Germany, their nitrocellulose was prepared from wood pulp.

Following is a brief description of the method used during WW II at the Krummel Fabrik of DA-G, as given in Refs 1 & 2:

a) Bleached cellulose in the form of crepe paper (made from wood pulp), was broken down in special machines into flocks and then blown into large drying chambers where the mossture content was reduced from 6-7% to

1-2% b) 25 kg of cellulose flocks were fed with stirring into a nirrator of 0.7 m capacity wontaining 1125 kg of mixed soid (MA), prapd by fortilying the spent acid

(SA) from previous batches.

Note: For NC of 11.25-11.50% N called PE-Wolle, the
MA consisted of 20% nitric, 62-64% sulfuric and 16-18% water; for NC of 13.2:13.3% N called Schiesswolle, the water; for NC of 194213.33 N called Schreswolle, the composition of MA was 25/25 nitric,67.565.55 allutic and 9-10% water. The time-and citration was 30 minutes and the temperature 30. c) The contents of the citrator were emptied into a

centrifuge (one for every 4 nitrators) and upun for 6 minutes at 900 mm

d) The separated spent acid (SA) went to coupling filter drams where the small torn particles of NC were separated and then to the fortifier.

e) The NC which was removed from the centrifuges and the filters was carried by a stream of water into preweshers where the bulk of the acid was removed by stitting with water

f) The aluny was then pumped to a preliminary boiling vessel provided with a double bottom of which the upper one was false, consisting of a acreen through which the wesh water was allowed to flow off at the end of the boiling period. Boiling was carried out at amospheric pressure: 3 hours for PE-Walle and 6-9 house for Schiegewalle a) After removing the acid water, the NC was carried

by as stream of water into the pressure boiling plant. where the material was cooked for 6 minutes in smin-less steel autoclaves, starting at 100° and finishing at 142-1450.

Note: Pressure cooking find a double purpose: it reduced the wiscoulty of NC, to the desired level and it speeded up the stabilization. The details of the pressure cooking varied from plant to plant.

h) A sample of cooked NC was sent to the laboratory and ". if the viscosity of the NC (as det'nd by the Hoppler method in a 3% acctonic soln) was within the gentred range, the charge was dropped into a pulping machine such as the Hollander or Banning-Seybold, Here the NC was bearen for several hours, while the plf of the slurry was maintained between 7 and 9 by adding sods periodically, it usually required 3 to 4 kg of sods

i) The pulped NC plus water was pumped into vertical rotating nieves where more water was added. Here the smaller particles of NC passed through avenue on sieve while the latter particles were retained by it. Then the larger particles were removed by accepers to be repulped, while the slutty of smaller particles went to a dewatering device (rotating drum sieve)

i) The dewatered small-particle material was transferred

2 ml of NO per | g of PE-Wolle) 'h) If the material was guncotton (Schienswolle) the above treatment was not sufficient and heating had to be continued until a satisfactory B-J Test value was obtained (Not more than 2.5 or NO per 1 g of Schiege-

I) In order to obtain NC of the desired N contest and viscosity, several batches were blended in large vata prayided with stirrers. The blended material was then stirred with a large quantity of water and run through Arie maps.

Note: Grit traps were cound vennels, conical at the hage-The slury entered from below and its velocity decreased as it flowed appeard (due to the increase in diameter of the of the weaseling such an extent that all the heavier particles (such as srit or dirt) dropped to the lower part of the vessel while the particles of NC continued to travel upward m) After "de-gritting", the slurry was thickened up

by passing it through a dewatering rounting drum for final dewarering. The partly dewarered marerial was sent to a centrifuge where it was spun at 1000 ross a) The resulting NC was shovelled into a mine-lined Iron container (provided with a cover), where it was weighed, inhelled and disparched either to propellent plants or to a plant manufacturing "Robpulvermasse" (Raw Page)

e) As the waste waters from the manufacture of NC contained so appreciable amount of suspended small . particles of NC , it was required that these particles be removed before the water was allowed to leave the pleat size. One method was to allow the water to reathrough so-called Donech traps. These were conical vessels with the aution part at the horson. The water flowed from the bortom noward: as the area of the vessel increased, the velocity of flow was reduced to such an extent that the suspended particles seried. The accumulated fines were periodically removed from the vessel.

Note: Is many Gennag propellants that were examined as Picatingy Amenal during WW II, the nitrogen content of the NC was around 1210.2%, which means that the NC was intermediate between the PE-Volle and Schiesewolle. One of the DEGDN propellants contained NC with N=10.4% (See under Propellants).

Stembacher (Ref -3) describes briefly various methods of manufacture of NC and gives compositions of mixed acids used for the preparation of NC with nitrogen contents of 11.6, 12.5, 12.75, 13.2, 13.4 and 13.7% Yields and sofubilities of various mitrocalluloses in 3/1-sther/elcohol mixture are also given.

Mirrocallula seculver (Nitrocallulose Propellent or Single Base Propellant). See under Propellant.

Nitrocklarin . A low-freezing explosive oil used in the manufacture of some dynamics. It consisted of 80% diairrochlorohydrin and 20% NG and was appared by signation of commercial monochlorohydrin containing glyceria F.P. Naoum, Schiene- und Sorengatoffe (1927), p 113 ].

Nitraform or Trinitromethone, described in the graritiristorie er l'infirementane, described la the general section, was prepared and investigated during will in Germany by Dr Schiemellachmide, He recommended the preparation of nitroform from turn-irromathane, ponanium bydroxide-and bydrogen peroxide, according to the following

C(NO.) . + 2KOH + H.O. = (NO.) . CK + KHO. + O. + 2H.O His preference for the above method was based on the claim that the method previously suggested by Orion and HcKee, depending on the reaction between segmainmenthane, by bydroxide and bydraune, is hazardous sance, is addition to K salt of natroform, sydragoic' acid and not named

Nitroform was liberated from its K salt by distillation at reduced pressure to the presence of sufferie neid.

The resulting product had a mp of 26.4° as against

obtained by some previous is ventigators.

Dr Schimmeischmidt also, found that nitroform may be extracted from the reaction product of scentiene and simic acid using liquid nerrogen dioxide at 0 as a selvent. This method of attrotors recovery was considered at of great importance, suce the product so obtained could of great importance, sures the product so photosic doubte be converted to intensitome these usels—only a small number of subtrict soid (See also index Tetrasitomethano). Note: Due to the abovergo of subtrict soid, which developed in Germony during WW II, may substance which rould be used in place of subtrict oriel were considered highly

used by place of sufferic soid was considered nightly desirable. For this research, the use of liquid nitropes and all the sufferictions of selections of the sufferiction of the sufficient of the sufferiction of the sufferiction of the sufficient of the su

also was found to be superior to Ne survey as once it was not destroy the resolution. In a contrast the resolution of th

The resulting Trintrepropulmethyl Ketme one an explosive comparable in power to RDX

b) When a stream of acetylene was hinkled through nitrofome commining a little mercuric nitrate the follo reaction took place: HCICH + CHINO J + CH CH-CINO J

Interaction of this compound with nitroform gave me extremely powerful explosive, helieved to be a mixture of 1,4 -DI (trinive) betwee and Hemmitreinebuteness

sitroethanoi: HCHO+CH(NO) - CH2OH-C(NO)

den Matteren Explosives, Peris (1902), p 523 described as explosive, consisting of NG+NC jelly mixed with about 10% of victic scid. This missare parented in 1887 by the Deutsche Sprengstoff Gesellschaft of Hamburg did not prove to be very stable.

Mitroglycerin and Nitroglykel (Nitroglyceria and Nitroglycol, abbreviated in this work to NG and NGc). The manufacture and properties of these substances are deacribed in the general section under Glyceria and Glycol, respectively.

In Gormony the nitration of plycerin or of glycol (ethyleneglycol) was conducted either by a batch process or by a continuous method, such as that of Schmid, Mrisanet or Biazzi. The nicration was made either separately for glycerin and glycol, or more often as mixoures, such as alycenia 60 and glycol 40%.

The batch method of mitration of glycerin, or of glycol or of their mixtures at the Krummel Fabrik Dynamit A -G may be given as an example:

al 300 kg of glycerin was run into 1470 kg of mixed acid, consisting of HNO 50; H 50, 52 and H 0-2%, countd in a stateless seed necessary which was provided with an air stirrer and cooling coils

b) In order to maintain the mixture in the nitrator at about soom remperature, the brine, cooled to as low se -12° was circulated through costs

c) After about 25 minutes of nitration, the air agitation was scopped and the mixture allowed to stand, in order to accelerate the separation of the nitration products. 70 g of an 80/20 mixture of Na flouride and of ignited kiesel subt was added

d) The separated oil was sir-aritred at 12° with 400 liters of water and after removal of the water, the oil was air-actived for 12 minutes at 40° with 500 1 of 2% sode ash soin

e) After cooling the mixture to 280, while still continuing to stir, 50 g of pulverized calc was added and then the mass was allowed to stand

() The separated oil was run through a pipe which ended some distance short of the storage cank. From that and of the pipe, the oil was transported to the mak by means of hand trucks

a) The spent acid which in the case of NG weighed about 1200 kg and had the approx compa: HNO, 7.5. \*\* about 1100 up and Hg 0 17,7%; and in the case of NGc (altroduce)) weighte ship: 1930 kg and had the approx compet RNO, 8.5, H SO 74.5 and H O 17%, from which the bulk of oil had been removed, was allowed to send for acveral days in lead-lined vessels, called "After Separatora". The separated oil was washed in a small auxiliary weasel first with water and then with 2% and and separators.

Note: The total yield of oil was reported to be about 211 parts per 100 of alyceria. Other plants separted worlds canging from 231 to 234, and for NGc 230.

h). The strent acid of (g), was bloom by comprehedair to a tank and from there to a separator in order to recover some more of the explosive oil. Then the said was transferred to the Recovery Plant where the nigne acid was distilled off, leaving week sulfuric acid as a residue

il As the waste wash waters of operations (d) and (s) contained emelf amounts of oils (NG, or NGc) it was necessary to remove the oils before allowing the waters to run into a stream, lake, etc. This was accomplished by allowing the waters to run through large settling tanks, sometimes installed in cascade form I In order to economize on the consumption of name

acid and to prevent poisoning of personnel all nature acid fumes (no well so netrogen oxide gases) were drawn from both the nitrator and separator by means

of a suction device and led to an absorption tower in which they were met by a spray of water to dissolve them and form nitric and nitrous acids

k) A sample of washed oil [ see operations (d) and (g) ] was sent to the laboratory for testing. The Abel test at 82" was usually about 40 minutes.

Note: The results of the Abel Test were usually higher than in the US practice. The high German results are presumably due to the fact that talcum was used in the separation of the oil (see operation (e)). The Americans do not use talcum to improve the separation of NG or of NGc from spens acids.

The Sythen Faunk of & A S A -G also used the barch process, while the Schlebusch Fabrik of Dynamit A -G had three different NG installations:

s) Batch piant

b) Continuous plant with Meissner nitrator and Biasti separators and washers c) Continuous plant-with Biazzi nitrator, separatora and

washers, installed by Mario Bisani, Switzerland.

In the Biazzi inscallation, which had an output of 800 to 1000 kg per hour, the aitrator was a cylindrical stainless steel vessel approximately 2 ft in dismeter by 8 ft 6 in deep (See Fig. 1, p A2/9 of Ref 5), Cooling was carried out by sunning chilled brine through a series of six concentric coils suspended inside the nitration veneral. Stirring was carried out with a mechanical stirrer situated in the center of the inner cooling coil and running at about 400 rpm. A tangential separator was placed about 2 ft below the level of the outlet of the nitrator and a 2nd separator followed the lat. The mixed acid-used in the nitration was approximately 50/50-nitric acid/sulfuric acid stored in a tank for at least 10 days and then passed through a stainless steel gauge before use. Procedure: -

a) The mixed acid, 5 parts, and giveerin (or siven) or glyceria plus glycol) I part, each metered by means of a commeter, entered continuously and simultaneously. the lower part of the niteson

b) The emulsion consisting of nitrated product (oil) and spent acid left the nitrator and was sup straight to a tangential separator placed about 2 ft below the level of the outlet from the nitrator

c) The separated acidic oil went to a stainless areal vesuel 11/2 ft in diameter and 2 ft deep, provided with 'a mechanical stirrer, where the oil was washed with an equal volume of water, while the apent acid (which in case of NG, had the approximate compositions HNO 11, H SO 73.5, H O 14 and NG 1.5%) went to a special lead separator, called Scheider. This operation permitted the removal of some additional oil before the acid was fortified to be reused for nitration of the next bath, or before the acid was sent to the recovery

d) After ore-making the oil with water, me emulaton Howed continuously into a tangential separator from which the senarated oil went to the pext part of the process

a) The acidic water (which in the case of NG had the approximate composition: HNO 10.6, H SO 1.1, H O 87.6 and NG 0.7%) went to another separator outside a mound surrounding the nitrating house where some oil was recovered

1) The pre-washed oil of the operation (4) went through two vessels in series, each of them equipped with a stirrer, Simultaneously with the oil a' Pin sods ash

solution, measured by a rommeter, entered the vessels. There was no superation of the emulsion between these vessels, and the oil/sods emulsion went from them to an annex (wash-house), located outside the mound surrounding the nitrating-house.

Note: All the above listed operations were conducted in the nitrating house, It should be mentioned that the attrator was provided on the bottom with a glass place which could be broken when it was required to drown a charge. A posumatic hammer operated by a handle at the door of the building was used for breaking the glass. The drowning mak, located below the nitrator, contained about 5 times the volume of the sitrator of 95% sulfurie scid-

a) The emulsion from the previous operation went through two separators located in the west house. The separator oil was collected in a rubber lined aluminum truck. holding 600 kg, while the wash waters went vin a cuscade system to a tunnel leading to the Rhine River b) The truck coats Soutralized oil was emptied into a storage tank where it was allowed to stay for at

least one day to permit the water to separate. Note: la a newer type of final settling house, there were 6 Sianzi enasential lend separators placed in caucade and working continuously.

i) The dried oil was removed from the atorage tank as seeded, by mesas of beavy rubber buckers of 40 kg

The average yield of dry NG from the Bianzi blant was 232 parts by weight per 100 pts of dry glycerol. The etability was 14 minutes by the Abel Test at 81°. When the nitration acid was made from acids recovered from TNT manufacture, it was sometimes necessary (in order to obtain satisfactory exability for NG) to include from 0.1 to 0.2% of No autfire in the sods washing liquor. During the war, however, diphenylamine ambilitors were sometimes used when the quality of the NG was unuscialactory.

in the manufacture of double-base propellants, NG was used alone, while in the manufacture of commercial dynamics-type explosives it was used in mixtures with NGe (mitroslycol).

Hitroglycarinsprengatelf (Nitroglycarin Explosive). See

Nitroglycoringulver (Nigraglycorin Propellant). A propellant based on NC and NG, siso called double-base propellant, Prenn and properties of typical-NG propellants are given in the book of A.Stettbacher, Speeng and Schiegastoffe. Zünch (1948), pp 41-43 See sino.under Propellance.

Nimosiykal (Nitrosiycoi), abbreviated in this book to NGe is described in the general section under Glycol. The manufacture of NGc in Germany was conducted in the same manner so for NG. Because of high volatility, it is not

advisable to use. NGc sions in explosive compositions (although the vermans sometimes did), but it is natisfactory to add NGc to NG in prefer to depress the freezing point of the latter. Such mixtures were used extensively in the preparation of commercial dynamics-type explosives. References: Same as under Nitrostyceria.

Mirroquanidin (Nigu) [Nitroguanidine (NGu)] described in the general section under Gunnidine was prepd in Germany by creating guaridine nitrace (GuN) with coner sulfuric acid as described by Schours (Ref 4). Briefly, the method was as follows:

In order to obtain 100 kg of NGu, 135 kg of GuN was added aradually to 300 kg of 98% sulfuric acid while stirring and cooling so that the temperature was not allowed to go above 45°. The resulting mixture was: run into a dilution wassel (maintained at 0°) in which the precipitation of the crude NGu took place. By using a centrifuge, the crude product was separated from the liquid phase which contained about 20% H 50. The coude material was dissolved in boiling water. mixed with the mother liquor from the previous ber a (see below), made exactly neutral by means of ance nin. filured and the filtrate cooled to at least 450 at low pressure. The resulting crystalline suspension was transferred by air pressure to a centrifuge, . This gave 1 purified NGs with a water robrest of abrat 6% and a nother liquor which was later used for dissolving the grade NGe of the next batch (see above 'Ref 4) The preparation of NGu was also described by Sterrbacher

(Ref 1)

### Uses of NGu:

A) According to Davis (Ref %, NGs in admission with Am nitrate and wax or partition was used during WW 1 for loading various bomba. These compositions were lastly insensitive to shork

B) During WW II NG- was used either in propellance such as the cool, erosionless and finabless triplebese propellant, salled Gudolpulver, or in explosive compositions.

Note: When intend d for use in propellants, the NGs crystals were required to be of such size and shape that when the ingredience of a propellant were rolled into sheets, the

incorporation was amouth and rapid. When intended for use in explosives, two kinds of NGu crystals were used: a) finest gain crystals (dust) obtained by rapidly evaporating a hot aqueous solution of NGu under high vacuum. These creatals were found to be suitable for press-loading b) crystals with high bulk density (above 1.0), obtained

by crysmilizing NGs in the presence of colloids: Fach crystals were found to be suitable for the cast-loading of TNT-NGu mixtures

C) As an example of the uses of NGu as a high explosive may be cited the 1800 kg AP bomb in which some NGu was placed in the none as a sort of protection (bumper) for the more sensitive mair charge consisting of "Filler 100"

Note: According to CIOS Rept 32 48 (1945), German preduction of NGu towards the end of WWH was about 1500 rons References:

Obseen Geren. A device designed in 1944 for controlling the bursting point of the air-to-air incendiary rocket, R 100 BS. It was claimed that the Obsero device improved the chance of a serike from a negligible value to a probability of about 0.4. References TM 9-1985-2 (1953), p 255.

Observing Bullet, naliber 7.92 mm, developed by the Deutsche Waffen und Munitionsfabriken A-G., Lubeck, exploded with a flash on hitting the target. The bullet explosed with a liash on nitting the target, ins pointer consisted of a seed caring containing a charge of white phosphorus, a deconator and a striker with a steel spring. The base of the casing was closed with a lead plug. Reference: H.Peplos et al, CKS Rept 33-20 (1946), pp 26-7 (See drawing on next page).

Debegon, German name for Cyclatetromethylane Tatra-nitromina, (H.C.N.NO.), called by the British HMM. (His Majesty's Explosive or High Melting Explosive). (ris seasesty a Espiciave or ligh Melting Explosive).
This compound whe present as an imputely in Henogen
(RDX or Cyclonite) when prepared either by the Evyeriahren
or by the KA-Verlahren, it was found by the Germans that
Cetagen is more sensitive to friction than Hexagen, but is more stable to best.

Qienrehe (Stove Pipe). See under 88 mm Wenpons.

Difensivities oines Trethmirtels (Offensiveness of a Propellant). In order to be sure that a wespon (such as a rifle or cun) will not burst on firing, it is opcessory to anow the presence developed on compustion of the propellant and der mite of pressure increase (Gesehwindigkeit der Druckstriggrang). If any of these values are greater than calculated for a given weapon, the propellent is not suitable. Also, it must be certain that the combustion of a propellant will not develop into a deconation. The faster the rate of increase of pressure of a propellant the greater is the Offenniviter.

This property of a propellant may be judged from the following test:

Usual fixed charges of various propellants to be rested are fired in a weapon provided with a device for determining the gas pressure. The tests are repeated with charges increased 25% and then with charges increased 50%. Table 30 gives results of tests conducted by Brutierig (See below).

6-following -is\_a\_brief description of tasks development
is Germany before and during W II:

as termany before and during WW II:

Due to the restrictions imposed by the Treaty of
Vernallies (1919), the Germans did not have the sight to
build make. Nevertheless they by-passed the restrictions
and garred to build reaks as early as 1926, when Rheinmetall Co came out with a 21-ton tank armed with a 75 mm gun. In 1977-1928 the so-called Landwirtschofflicher Schlopper, abbreviated as LAS (Agricultural Tractor) was constructed, which by a clever arrangement, could be easily converted into a mark and this was later done. The resulting mark was designated as PzKpfw t or 5dKfz 101. its first variation (Model a), which appeared before the Spanish Civil War (1934), weighed 5.7 tons and had a man Spanish Civil War (1944), weighed 5.7 tons and had a man append of 25 mph, while it second variation (Model 5) weighed 6 tons and had a man append of 52 mph. Hoth models were appended of 52 mph. Hoth models were a man and had a man append of 52 mph. Hoth commander's near the first house the second of the commander's near the first house the commander's near the first house the fi

Dusseidort.

The lirst design project was a 10-too rank begun in 1934 out of which the PEKpfw II or 5dKpfx 121 was eventually developed. The handling of this project set the pattern for nearly all the casks developed up to about 1941, such as 30 - 2, 33-4, and even 60-t tasks (designed by themschel in 1937-1939), but they were never mass-produced.

Pakpiw II

The onginal tank, Pzkpiw II (Sdkia 121) weighed

about 11.5 tons and carried one 20 mm gun (either 2 cm KwK 30 or 2 cm Pak, 38) and one 7.92 mm MG, its mass speed was 30 mph. The mak "'s made in several modifica-

of some mechanica mirrors, in this time to the acceptant for service and preference was given as the mak Hawe I Porticle and preference who given as the mak Hawe I Porticle modified the chassis of his task and convented it to a self-propelled motor carriage known as Ferdimand, Palide VI Preference, Solfta 184, Japa Px VI (P) or Tiger Provache, it was equipped with one MG and one long-barreled 88 mm gun (3.8 cm KwK 35), very effective against armor. This mak destroyer mas supersached by Elebert (Elephann), designated as 3dKz 184s, which carried one MG and one BB mm A/T gun , 71 calibers long (8.8 cm Pak 45, L/71). The ensemble weighted shour 75 fone and had a max speed of 22 mph. Note: F. von Senger und Exterize (Ref 9, p. 192) called the above tank destroyer, the Jude's VI Aust Fersche, and gave

its properties as follows: wt 68.8 metric tons (about 75.6 short tons), max speed 35 km (22 mph) and it carried one 128 mm A/T gan, 55 calibers long (12.8 cm Pak, L/55)

c) Tiger II or Tiger 6 tank, designated PzKpfw VI (8) c) Tiper ii or Tiper ii ont Kigner in the King Tiper or Sekke 1821, called aiso Keinparinger (King Tiper or Royal Tiper), weeghed 75 ones, had a max appered of Jamph 71 calibora (see Sea 182), and one 88 mm pan 71 calibora (see Sea 182), and one 88 mm pan one 183 ones to the Sea 183 on designed for submecessor up to 1) ft nod all the 10 interwere made varieties of the same puber scale. It resembled
the Pischer in appearance but was larger and more
effective in performance. Although fits design was
performed by the 10 intermodered by the 10 interm

e) Jone Tiger or Tiger Jüger was a 77 ton tank destroyer. equipped with a 128 mm gun, 66 calibers long (12.8 cm Pak 44 or 12.8 cm PJK 44). Max speed 25 mph Past as or 12.6 cm FJE as, Mass speed 2 mpn ) Sawmeiger (Stumpagner VI mis 36 cm Münsch), called also Stummabree, was a self-propelled mount consisting of a 360 mm Rocket Projector (36 cm Raketenwerler d) mounted on a Tier E chassis, if "wighted 68 cons

During Forld Wer L. L. Seen, years also used some Casch makes, seen, on the Toda Germans also used some Casch makes, seen, on the Toda Germans also used to the Pilese. The original model, built before by Scholler and Scholler

carried a flame thrower in lieu of a gun. Other T-38 versions, served as self-propelled mounts; the first SP mount, designated 15 cm siG 33/1 set Prkpiw 38(t), carried a designated 15 om site 33/1 out Frapre 38(1), carried a 150 mm medium heavy infanty gus (how sizer) 33/1, the second, designated 2 om Fish out Fragier 38(1), carried a 20 mm AR que, south desired, archamed frapred 38 (Marten 50), extended in even modifications one, designated 54Kin 50, extended in even modifications one, designated 54Kin 189, while the opportunities of the second of the secon is briefly described above under Pakpfw II. Some of the French tanks, such as the Lorraine, Renault,

Hoschkien, and Char B served as gun carriers. One of the forceign tanks used by the Germans was the Swedish Landsworks (L.40), designed by Serms. The cank was baild during you in a company of the Germans was the cank was baild during you in a too dopped (Ref. pp. 110-115). There were also many wheeled armored cars built in Germany. Some information about them in given by

acrett (Ref 7, p 116). Several Experimental Tanks other than those previously mentioned and also cank destroyers were designed by the

mans, but some of them was put info production.
Following is a partial list of these vehicles:
a) Lespard (Leopard). A 28-ton tank developed in 1942

at Dannier-Benn plant (Ref 5, p. 10)

Pannerschnelimine - See under Landminen and also p 262 of TM 9-1983-2"(1953).

Pennerschroek, Pennerfeint, Pannerscheftenane und Pieuchen were the shaped charge weapons developed before and during WW II in Germany.

The Panzerschreck was the shaped charge rocker similar to the American Basocks, but was benvior and had a shorter range than the letter. It was superseded by the Passerfacet, which was a better weapon with a unite of 150 mesers: Apother weapon, called the Pippehen, was essentially the &\$ cm Panzerschmek mounted on a lishe carriage. The Pannerwirthnoone was a long-range weapon for shooting a shaped charge, developed by the Rheinmetall Co. it was a smooth-bore 8.0 cm mortac. (Not also under 80 mm and 86 mm Veryons).

Penro . Same as Peault (PETN).

Postuntit . See Swine nection.

Postul oder Pentritul corresponds to the American Penculite, described in the general section, (See also Fillers Nos 16, 17, 28, 42 and under Pretrit).

Pontrinit . See under Swise Explosives.

Pontrit adar Hitraponto (HP)- See greeni neccios under-Pentneryskritolsereneitrate (PETN), it was magnifectured in Germany by batch, continuous or semi-continuous mechada. A) The batch method was essentially the same as that used in the HS A

B) The continuous method, as conducted at Trojudori Fabrik, DA-G consisted essentially of the following operations:

a) Nitric acid of the highest concentration and PE in the ratio of 5 to 1 were introduced simultaneously into a nitrator of 54 liter capacity. The PE was added by means of a "dosing" machine feeding at the rate w 600 g every 47 seconds. The temperature was maintained at 15-20 by means of cooling coils

o) The solution-suspension of PETN in sitric soid was led to an after nitrator, where the mixture was main-tained at 12

c) After this it went to a third vessel, where a strong iet of water diluted the solid and precipitated that part of PETN, which was dissolved in the stronger acid d) The slurry was run through a vacuum filter and the ppt was rinsed several times with water

Ger 128

e) The precipitate was transferred to vessel where it was bresed in dilute sods ash role to 80-850 from which PETN was not so a 2nd suchiliver

f) After separating the ligher by vacuum fixmuor, the PETN was washed with water and aspirated to a moterure concent of 7-10%

g) The moier material was dissolved in 98% accrone -prehensed to 56°, and allowed to run gradually and with stimms into a vessel containing cold water b). The accross was distilled off and the covarallized PETN separated from the bulk of the water by vacuum. It was then packed in subber bags and carried to the phiegnatizing house

i) For phicamatizing (descriptions) PETN, the Trossdoct Fobrik, DA-G uned either Montan Wax; or a synthetic I G Wax - 41s. The amount of wax added to PETN was usually 10%, although mixtures with as " high as 60% were known. The cryamia of PETN were suspended in cold water containing some common sale in solution. The temperature was caused to about 40 and molten was was added, in a thin stream. The temperature was enisted and the mass maintained at the boiling point until about 20% of the water had evennessed

i) The slurry was then cooled for adding cold waited and filtered. After washing the phile matized product with water and removing as stuck water as possible by section, the product was dried to reduce the moisture content to below 0.1%. The material was then acceened and packed

C) The semi-continuous method as practiced at the Krimmel Fabrik, D A -G was essentially-as follows:

a) The nitrating apparatus consisted of 3 stainles steel vessels connected in series. A charge of 200 kg nitrate in the general section. of PE and 1000 kg of 99% nitric acid-was fed into the first sittetor (which was cooled with bring circulated is coils and in a jacker) where the eats airration cost place at 15-20 during about 10-15 minutes. A second charge of PE and HNO, was meanwhile weighed and transferred to the first nitrator immediately after the lat batch was transferred to the 2nd nitrator (which was also provided with jacker cooling). Following this, " the let barch was transferred to the 3rd nitrator, the 2nd batch to the 2nd nitrator, and a 3rd charge was introduced into the 1st nitrator, esc. The total time of nieration was about 40 minutes

b) In the 3rd nicrator, the mixture was diluted with water to give a waste acid of about -30% attempth c) After filtering off PETN from waste acid, PETN was washed with water and then digrated with node and solution in a stabilizing vesuel at 60° until the slarry was weakly alkaline (cime, about 1% hours). This was

followed by water washing directly on the filters d) The next operation, crystallization from acrees was done in a continuous manner in a battery of 6 distillation vessels connected in series. In these vessels, water was added to the solution and the acutous gradually evaporated leaving a water slurry of PETN. After removing the bulk of the water by vacuum filtration. the moist PETN (10% H.O) was transferred to the was phiamaciaes

e) Phiegontization was carried out in a water slurry of 315 kg of PETN (contg 10% H O) plus 1200 kg of water at 83°, to which wax, usually Montan or I G Wax -the. in the proportion of I part was to 9 parts PETN by dry weight, was added with stirring

Note: According to German Rathroad regulations, phieg matined PETN was permitted to be shipped if it contained at least 6% wax. Unphlegmatized PETN required at least 10% of water for shipping.

PETN was also phiegmatized by the addition of TNT (20 to 50%) and the operation was conducted by suspending PETN in about 6 parts of water at 70, heating to about 80° and adding molten INI with agitation. This was followed by cooling, filtering and drying. The mixture was sllowed to be shipped dry (Ref 1).

The manufacture of phicemetized PETN at the Wolfrage hausen Plant was deactibed by Swanson Ref 3 and CIOS Rept 25-16 (1945), Abbreviations: PE Pentaerythritol.

References: Same as under Pentritupmenestoffe.

Pentritagramentelle (Pentagrithrital Tetranistate Explosives). Straight Pentrit (PETN) was used under the name of Filler No 3-NP as a bursting charge in some grenades and small shells (such as the 20 to 50 mm), as well as in a lower detonator. Straight PETN was also used to a propellent

The use of PETN desensitized with 8-10% wax was much book common. Note. The wax used in German explosives was sepath-

Montan Wax, obtained from the lignifes found in many pass of Germany and countries securited by her dering WW II. The properties of Montan wax are comparable to those of Camanba wax imported from Brazil, German PhTNiway mixtures were usually dyed pink. The explosive properties of such mixtures were the same as those of the corresponding American minutes described under Pentserythrical Term

The principal uses of PETN-wax mixtures were an follows: fiflers for various shells, bombs, granades, and some sea mines; fillers in some shaped charge ammunicion; standard boosters in chemical and incendiary ammunition: attandard sub-booster in all types of emministion and as the core in a detonation fuer.

Explosives, desensitized with TNT, are briefly described under Pentol or Pentricol as well as Fillers Nos 16, 18, 28, 32-14, 36, 37, 42 etc.), In some mixtures Al was incorpotated and these were used in underwater amountains. Besides these mixtures there was also a piantic

emblasive (see Filler No 43) and explosives consisting of PETN, RDX and wax (See Filler No 45). References 1) Anon, Affried and Enemy Explosives, Aberdeen Province

candled, time to reach peak massimity 70 millionecode
and potal light output 65 million learnmented condite

and notal high course 50 millions harmonous candid and notal high course 50 million harmonous called Gross 64 v), he was insensitive so builet sepact not had a peak light insensitive so builet sepact not had a peak light insensitive and 50 million floher endfast. The time of the control of

PH-Sain (PH-Sait), German name for Ethylenediaminadinitrote (EDDN), described in the general section, in Germany PH-Sale was prend by treating subviscedichloride with amounts and NaOH, followed by attraction with attric acid not arroager than 50%. Although PH-Galz has a high m.p. (185°), it has the property of depressing the mp of other high is p compounds. For this reason, the Germons used it to obtain tastable explosive aixtures. For instance. a minute of 45% PH-Sala and 55% Am nitrate meles at 105" and can be exer-loaded. Such a mixture ban an explosive power equal so that of TNT or Amazol, but it has the 'disadvantage of shrinking considerably on cooling. Addition of squeous Ca nitrare so this misture practically chminates shrinkage and maulta in a very good cour. The following mixtures coorg PH-Sala were used for filling some shells as a substitute for TNT.

n) Ammonite NH NO; 46, PH-Sale 46 and Ca(NO) -4H\_O(tech) B%; density of iragman m 39-40 m. Gen Fragments Density Tout) -

b) Ammonatt NH NO 55, PH-Suiz 10, Ca(NO) 441 O 10, RDX 20, and NaNO 5%; d 1.53, casting semp 106, density of fragments 40 m (Ref 3)

e) H-5 (Ammonit): PH-Saiz 10, NH NO 50, NaNO 5, Ca(NO ) 4H O 15, and RDX 20% (Ref 2) d) 5-16: PH-Sala 10, NH NO 32, NaNO 6 or 8, KNO

2 or 0, HDY 18 and Al (powder) 40% (Ref 2) a) S-22 (Heso): PN-Sals 14, NH NO 45, NaNO 9, ENO 3, RDX 14, and Al (powder) \$5% (Ref 2) f) \$-22 (Hexa): PH-Sala 14, NH NO 45, NANO 9, RNO 3, HNDPhA 14, and Al (powder) 15% (Red 2)

g) Amond 41: NH NO 52, PH-Sala 30, Ca(NO) -4H O 6.RDX in and Montan was 2% (Ref 3).

Compositions containing Al were particularly suimble for underways weapons because they possessed high blass effect. PH-Sals could also be used arraight or slightly phlesmatized, in the latter case, it was particularly suitable for use in anticoncrete abella, called Be-Granate (Be in the abbreviation for Beton sconcrete).

Pfleteniere (Picric Acid) (P A ). Methods of preparation and properties are given in the general section, it would be of interest to know that in 1892 the Chemische Fabrik Griesheim, Ger, Pat 69 837, developed a unique process for loading till shells with P A. This was carried out as follows: a mixture of P A and 5 to 10% of TNT was placed in a suitable mold which was heated for a short time to a temperature of about 82°C which is slightly above the mp of THT. On cooling there was formed a solid block consisting of crystals of P A consued to the thin intermediate layers of solid TNT. In place of TNT other solid 

During WW II P A was manufactured for use as a seter (compressed), as well as a filler for some shells. land since, depth.,charges (see Filler No 2) and as a filler in stick hand grunndes (see Filler No 5).

Cast P A was used under the name of Filler No 24-Abbreviationa: DNS Dinitrobenzene; DNCra Dinitrocrandi; Diff's Dinitrophenel; DMY Dinitrophene; TNCrs Trinitrocread and THT Trinitrotologue.

inner cases be more interest and settlee the litted tigning of 12 mm Hz Geenade (Spreagpatrone) for the right plannel (Kamplpiatode) consisted of a die cast theminen body provided on the oasiele with five provers making me crylinder of the settlement of the provided on the case of the consistency of the crylinder containing two PETN/was, publicts appetrated by a cardivated time. The non-activities of the cardivated time. The case activity consistent band. The halfs which reserve in the provided striker band. The halfs which reserve in the provided on three limitaries which was assported on three limitaries of the limitarie the gains and trage was constanted as a sur space. The propellent strage was constanted as a cup which was placed in the Cattridge attached to the tail section of the gements. There were 10 holes in the cup to isad the propellent gazes to the base of the greende. On firing, the passe propelled the greended not rotated it because of the 'lifting. The nethack caused the collar in the fuse to move back crushing the aluminum pine and the contribust jours caused

the balls to fly outward. This partiy freed the surker, but it still was held by the creep sprang until the archer head his a solid object (pp 545-4)

23 mm Hollow Charge Signal Pistol Grenade, PEWK LP (Pannerwurfkörper 42 für Leuchmistole) wes (tred from the 27 mm Walther signal pistol fitted with a 23 mm rifled liner, a special sight and a folding but. The waters of the gleende was pear-shaped and contained the shaped charge and as impact cap. To the rear of the warbend was attached the tube containing the gaze fure-denoistic and the gaine. A short length of this tube was practiled. A thorner bab commissing a shearing hole, propelling and a necessary conmining a shearing bolt, propellant and a percussion cap was attached by a shear pin to the pictified section. On firing, the propellent games drove the shearing boil forward causing it to been the shear pin. This released the menade and armed the graze fuze (by serback) (pp 344-5) 27. mm Pistol Geenade Massage was fired from a 27 mm ti fled wignal pistal (Kampfpistole). The round committed of a position a alumnom cylinder (continuing a smoke generator. a .colored silk streamer and an ejection charge), a black plastic head (contaming a message or other small object) and as aluminum careridge case. On firing, the flash from the papellant ignited the delay pellet in the grande base plate and this, in turn, ignited the ejecting charge which expelled the message comminer, silk streamer and smoke

expelled me measage commones, sith streamer and suppose generator, (p. 345).

g) 27 mm baltiseare Stpan Cantridge fired from a signal pissol, congesisted of a light alloy outer cylindrical casing (the base of which contained the propellent and Partuesion cash) and, as inner cylinder which contained skir green cap) and so mer cytener which contained sixt green and red ster units. Senning through the center of the stay units was an assembly of two concentric brass tubes which were hald in position by a central cannelure into which the inner cylinder was indented and fixed by means of a steel pin. The outer brass cutie had one set of 6 flash holes adjacent to the inner surfaces of the six stars. The inner brass tube also had a set of flash holes which means of a setting cap could be aligned so as to permit the ignition of a selected number of combinations consisting

the ignation or a selected number of compinations consisting of red and green stars as shown below: -a) 5 red & 3 green, b) 1 red & 2 green, c) 3-red & 1 green, d) 1 red & 3 green, c) 2 red & 2 green and f) 2 red & 1 green, The inner brass rathe was filled with black powder and was closed at the lower end by a screwed plug which con-

tained a delay polict.
In firing, the inner cylinder was ejected (by propellent range, noe most cylinder was ejected (by propellest gases) from the quiet light alloy case, and, alter the drigs, pellet had burned through the flash passed immediately along the whole length of the inner base, 10ke, igniting and ejecting the sters in accordance with the setting. The entare which were but in given fell to earth in the common of the c

Plastic Emplosives. Several plastic explosives based on PETN and RDX were used in Germany during WW II. One of the earlier compositions consisted of RDX treated with American vaseline (see Note) until this vaseling became unavailable. Thereafter mixtures called Plastic and Hexaplant, which did not contain vaneline, were used?

Note: American vancling was considered most anitable . because it is long liber" and can be stretched like dough to form threads. European vaseline, such as the Russian, is not tacky and does not produce good plastic explosives. (See also Plastic Explosives in the general section). Reference: PB Rept 925 (1945), pp 74 & 77.

Pleaties. (Kunstatolie, Preas-stoffe); Manufacture and properties of plastics are described in the following References:

Riestian in German, Ordnenca, During WW II there was a growing use of plastics in plants which manufactured acids, explosives and ammunition. For instance, linings ( for canks and pumps, funnels, pipes, plastic trays for drying explosives, sealing plugs in delay deconstors etc. were funditured from plastic material. One of the plastics developed in Germany was Mipolam. Others were Novolac, Lignotol, Igelimulver, Trolicul etc.

Pleatement (Plantomenite). According to Deniel (Ref 1) plantomenites were propellents invented about 1889 by Guttler. They consisted of mixtures of the nitrated products of cellulone, sugar storch, aromatic compounds, sec with oxidizing substances such as inorganic nitrates, chlorates, chromates etc. These compositions were modified beginning 1897 by incorporating 0.5 to 10% of colophony.

According to Marshall (Ref 2), Plastomenize was an early (1889) sporting amokeless propellant prepared by gelatinising NC with DNT.

Colver (Ref 3) stated that Plastomerice was a German propellant prepared by blending 5 parts of molten DNT with one part of hitrolignia and sometimes small anounce of Ba nitrate. After incorporation the fused mass want granulated.

Brunswig (Ref. 4) gave Plastomenit, as containing suncotton 67, Ba nitrate 13, TNT 13, DNT 6 and moisture

Pleatrit . See Pleatrotyl.

Pleatretyl or Plasfelt, According to Colvet, High Explosives (1918), p 249, plastrotyla were plastic explosives patented by C.E.Bichel in 1906 (Ger P 181 574). They were prepd by mining 85 to 87 parts of TNT with liquid of solid resins, such as coparba balsam, benzoin gum or styrax, with or without liquid DNT. The plasticity could be increased by incorporating some colled cotton, Table 37 gives some examples. (See next page).

centur to tweeive a brase savil ping. The ping had a central flank channel and was recessed at the rear-ward said to form an april and to hold a brase primer

cup , containing the pamer mixture. The cup held the cup - containing the pamer maxium. The cup held the miximin against the avulle. Directly shows the plug was placed a small amount of granular black powder with a black-powder pellet covering it. The pellet was held in position-by a brass washer crimped ower a vanuabed fabric disc, when the firing pin hit the primer, the cap pushed the primer mixture against the anvil, thus 'causing the mixture to 'ignite. The flash from the mixture west through the channel toward the tum fixed the propelling charge. This primer was used in annuarison for field gunn and howitzers from 7.5 cm to 21 cm (excluding the 7.5 cm StuG) and also for the 5 cm Pak and the 8.8 cm Flak 18 and 36. (See also Primary and Initiating Compositions).

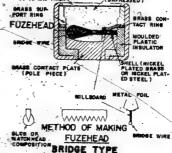

Primer, Electric, Bridgeless Type was developed by the Deutsche Wallen- und Munisionslabeiken A-G, Lübeck, It consisted of a cylindrical casing (zinc piated steel) washer (attached by shellar to as insulating the washer (attached by shellar to as insulating to the washer (attached by shellar to as insulating to washer (attached by shellar to as insulating to washer) and a consect sing. A current of 120-160 volts was required to fire the primer, Robert 37-20 (1945), pp 75 & 77. References the Pepelor, CloS Rep 33-20 (1945), pp 75 & 77.

Propogendaryanete (Leaflet Projectile): Our such projectile (caliber 105 mm), designated as 10 cm Weiss Ref Geachess, is tencribed in TM 9-198-3 (1933), p 642, it contained 28% lb of leaflets had a small therage of black powder serving as a burster. The shell was fired from light field howitzers such as IFH 18, 18/1, 18/2, 28mM. 18/39 and 18/40 (See drawing next page).

Empayamentembers 41 (Leafter Rocket), calibet 73 pm, consisted of new neel bushes screwed into a consulption. The lower part consained the toccurrent pinks. Consisting of a cylindrical stick with also longinous perforations—one in the center and eight in a circle around the central bode, Below this were 12 venturi set in two concernitions. The upper section of the misail's continued an inner cylinder (which was split longitudinally) with leaflets wrapped around a sceel, apring which was kept under Compression. The misaile was splin-sublished and was fixed from a single-robe launcher called the Prapopularies for the proposition of the continue of the con The propellant was ignited by means of the percussion cap and when the rocket reached its destination, the ignites (located between the propellant and leaflets) fired the butsting charge. The resulting gas pressure e ected the inner cylinder and the plants cap. As the split cylinder emerged, it tell apart and allowed the comprehend spring to scatter the leaflets packed around it. Note: The Am oxalare was adoud to dominish the danger of ignition during rolling. Abbrevintions: See under Table 44

The information contained below was derived from results of analyses of captured German propellants conducted at Picationy Arsenal, Dover, New Jersey (mostly by P.R. Houken, Jeand H. Jadomitt of the General Laboratory) and also from documentary materials gathered by various American and British missions near to Germany directly after remination of the War, (See Refs 4 and 10).

Following is a general survey of propellants used ducing WW II:

a) Both single and double-base propellants were used by the Gennans during WV II. In double-base proprilants it was the tendency to replace NG by DEGDN. This was partly due to the excessive experion caused by NG propellants and partly because of the shoringe of glycerin while DEG could easily be prepd synthetically from occupiene. Also, DEGDN is a hener gelatinizer tur, NC than NG and for this reason smaller amounts of DEGDN could be used. The DEGDN propellance possessed much lower calendic values than NG propellents but they were not suitable for use in gropical climates on account of the high vapor pressure (and consequently high volatility) of DEGDN (ret also "G" Pulver), Still conler propellants, which were also less erosive and practically free from muzzle-finals were obtained when large amounts of nitroguanidine (NGs) were incorporated, as for instance, in the com-position: NGs 30, NC 43, DEGDN 20, stabilizers and Plasticizem 7% (see also Gudolpulver)

b). An flash reducers the Germans'used sales of potassium such on sulfate, chlorids, nitrate and qualate. They were frequently supplied in bugs for use only at night as they produced empke which was visible in the day time. (See -Vorlage) in propellants conta NGu there was an necessity to use the above salts because NGs acts as a flash reducer

c) Some German propellants contained between 1.5 and 3.0% of hydrocellulose, presumably to improve the burning characteristica, or to reduce flanh

d) An interesting feature of German propellants of low catorific value was the use of mixed gelatinizerssubilizers, such as centralizes, acardite's and wethanes. It was claimed that these mixtures had a better effect on, the working properties and stability than when used individually

e) Of the other ingredients, magnesium oxide was included as a lubricant to facilitate solling and extrading operations, graphite was added to reduce the formation of static electricity during tennulacture, and the inclusion of about 3% alpha-MNN resulted in reducing the charge of low calmific propullants as much as 10%

f) It seems that there were no restrictions regarding the composition of the propellants provided the ballistic properties and stabilities complied with specifications. The composition of propellants manufactured as different plants but intended for use in the same type and caliber or gast were not the same, although day all passars inspection tests.

Table 42 gives compositions of some single-base (nitrocellulose) propoliente examined at Picatinay Argenal.

(See next page)

Hemark - On Table 47

The propellants listed in Table 42 contained a number of fratures which are worth noting, such as:

a) lione of these propellants contained a sufficient amount of con-volatile plasticizes to colloid the NC as effectively as is generally required, it is assumed that a volatile solvent was used in their manufacture which was later semoved by Usying. The amount of centralite present in some of these propellants would not be sufficient to gelectrize the high-nitrogen NC that was used in them but would be sufficient as a stabilizer

b) Since an insufficient amount of centralite was present for the complete gelecinization of the NC, it is presumed that camphot was used in some propellants to superficially gelatifize the surface of the grains. Thus, it would act to a deterrent and cause the propellant to burn more processively >

"c) Several propellants were not only coated with graphing, but some of the graphite was iscorporated in the grains. Concing with graphits was usually done top the following purposes: to decrease the possibility of ignition by static electricity, to make the grains more "fifte flowing" while loading the cartridge cases and to decrease (slightly) the initial race of burning Incorporation 3f graphice in the grains was applicantly done to improve the burning characteristics of the propellant d) When graphite was used for coating only, it is probable

that the grains were previously given a surface treatment with centralite or other stabilizer-gelatinizer as a determent ? coating to make the propellant more progressive burning e) Potagaium salts (such as K sulfate) found in some Gernan propellants, were evidently used as flash reducers, In some cases, however, markings on the bags included the abbreviation Man Puly which senade for Manover Pulver Note These were usually rapid-burning propellents because they were porous. The porosity was obtained by

incorporation and subsequent elimination of most of the potamajum salt by leaching with water f) Some of the propellants examined at Picatinas Armenal. contained DPhA as well as DBuPh. As none of the German pre-We Il single-bear propellants conmined DPhA, it was

presumed that chiese samples were reworked captured French or Belgina propellants g) One of the samples examined at the Amonal contained a

large amount of PETN (63.8%) dispersed through the mass of No. None of the Allied propellants had such composition.

Our of the single-base (nitrocelluldes) probellants used during WW II was prepd by gelatinizing a blend of two nitrorelluloses one tol N content less than 12,5% and another of N content more than 13%. The gelarmizer used was an alcohol-accrone solution. [ See Nitrochemie Industriesningen A-G. Ger P 715.811 (1941), C.A. 38 2211 (19(4) %

In Ref 4, p 41 is described Nitrocollulasa-Blattebansulver (Nitrocellulose Flake Propellant) which was prepd by thospoghly mixing in the presence of otherel-olad 3 parts guncotton' (Schienawolle) of at least 13.15 N content, I part of solubie NC (Kollodiumwolle) of at least 12.6% Content with 0.5% of stabilizer (such as diphenylamine) and 1% of flash reducer (such as Na ounlate). After the mass was flaked, the surface of the kining was treated with centraliste and finely pulverized graphite. The flakes were about 0 3 mm thick and their surface was 1.4 mm2.

Remarks on Table 43:

The double-base aircocallulose-nitroplyceria propellanta listed in Table 49 were somewhat different from the American and British propellants, as can be seen from the following remarks:

a) In cases in which large amounts of commilies were present, in served sor only as a stabilizer, but also as a plassicistic especially for low-intented NC. The amount of NG in such propolelants was correspondingly decreased. In other cases where the amount of contailing was madely on the contract of the contract

b) it has been shows that when contralite is used in large amounts, it also acts as a flash reducing spacet. The same applies to caredife (asymmetrical diphenylures). When scandies was used as a stabilizer, an amount as low sec 0.07% was sufficient.

c) Vaseline, present is some proprilants was supposed to act primarily as a cooling agent to lower the compensature of conduction and to reduce emelon). It also noted his activations are not coming extent because the manufacturing hydrocarbons present in wastline combine with the passistic of aircogest and thus stabilities the powder; that he est bread, however, that were line to not particularly effective in reducing hydrocarbons.

d) Graphics was used for coating some propellants (see Remarks (2) and (d) to Table 42, but in propellants of large graps size, such as the 155 ms, 130 ms and 120/45 one weapons, no graphite coating was used at the companies of the companies of the companies of the coating was used.

weapons, so graphite costing was used

a) As it some other German propellants, graphite was used not nelly as a costing-agent but it was also distributed, throughout the mass of meterial. [See Remark (c)/

on Table 42 ].

Table 44 gives compositions of some double-base propellants, based on DEGDN (dischyleneglycoidinitrate) and on riple-base (NC-DEGDN-NGe) propellents.

(See peng page).

# Remarks on Table 44 (See previous page).

Although the above DEGDN and NGu plus DEGDN propelleasts were similar in composition to NG propelleasts listed in Table 43, they had some features which are worth sociage such sa:

so only section as definite relationship between the perol There was definite relationship between the perological period of the period of the period of the RC was depressed as Not of ECOM (which has about the same promptial as Not of ECOM (which has about the same promptial as not period of the period of the same promptial of the period of the period of the period of the same period of the same period of the perio

b) The use of low airrogen content NC, such as \$1.8-12%, in DEGDN propellests may be explained by the fact that high N content NC is much more difficult to geletinize with DEGDN.

on or of the control propellants contained about 30% NGs and only about 40% of NC, without any unabliter. In most of these about 40% of NC, without any unabliter. In most of these control of the contro

e) From the American point of view the DEGDN propollants have the following disadvantages over propellants based on NG.

1) They are more volatile

2) Less sensitive to flame and thus more difficult to inche?

3) More toxic to personnel handling them

4) They contain an ingredient (DEGDN) which is more difficult to authilize than NG.

H.Marsour et al, Mem poud 35; 280 (1953), gives the composition of a German propellant, used in rounds for 50 mm simplane cannon, as follows: NC (N content 11.81%) 63,51 DEGDN 76.5. centralitie 8.0 and vasaeline 2.0%.

Some information on DEGDN-NC propellants prepared at the Discherg Fabrit, DA-G may be found in Ref 7. Two of these propellants used in cainform are listed in Table (5m.

The same Ref 7 gives the composition and properties of the DEGOD propellate manufel by the Volff Co Plant as Bimilize, near Valerode: NC (N contrast 12.13%) 28.6 (
DEGON 17.4 DPhA 0.5, Cent i 0.5 and TNT 53.0%, Oxygen balance 16.51% and calorific value 750 kcal/kp.

Some double-bane (NC-DEGDN) and triple-bane (NC-DEGDN-NGu) propellants manufactured at the Directory Fabrik, Dynamit A -G were described in Ref 5. Their composition is given in Table 45b.

(See next page) .

Abbreviations: (See under Table 44).

18 Ref G is described the manul of NC and propellants at the Kümmel Fabrik, Dynamit A-G, while in Ref is described the manufacture of NC and propellants as the following plants: Troided Fabrik D/A-G. Elembander Fabrik

is the prepo of propellants at the Rottpell Plant the Slerid consisted of 20 parts NC, N content 12.5%, and 80 carts of NC. N content 13.3%.

Table 46 gives some properties, including the burning characteristics, of several German propellians examined at Piccationy Arsenal during W II (Refs 4, 10a, 10f and 10 g).

(See nest page). Remarks on Table 46:

Remarks on Table 46: a) In the compositions given in Table 16 only the main ingredients are included. Other components, such ass such lass stabilizers, praphic, etc. were given in Tables 42, 45 a 44 b) Force of a Propellant (HeV) is a function of its chemical composition.

O Quickness (a) of a Propellant is a function of granulation as well as of its composition. The most important variables are total volatile contents and self-time. The quickness of the properties of the properties of the quickness of the properties of the properties of the deposition of the deposition country is used to a large the quickness.

d) The relative gueleness of properlants is obtained by dompaing the buming near with he rate of a susadant's if companison is made between a German propellant and a standard American propellant, the results are likely to be malesding sance the German guns (made with a heavy bleech) used propellants designed to develop the anxisum pressure repolly and after the shell had travelled only a

Abbreviations: A Constant called Vivacity; C Rate of evolution of hor gases at a pressure of 20,000 pai in litera at atmospheric pressure / sq.cm of surface / second; H Heat of Combustion in kcal/kg; P Pressure of propellent gases in pdi: V volume of rases liberated in 1/kg. Burning este (quickness) of the propellant at 20,000 pai in inches/sec; (HnY) Force or Timemodynamic Potential. Other abbreviations are given under Table 44.

abort distance along the bore of the gun. On the otherband, in American guns with a lighter breech the propellabte ore designed to develop the maximum pressures more slowly and after the shell has travelled a greater distance along the bore of the gun

e) in the relacion of quickness to composition, it may be noted that the single-base propellants are the slowest and are comparable to those double-base propellants which contain NGu. Propellants containing NG are usually the fastest, followed by DEGDN propellants, in some cases, however, DEGDN propellents are faster than those concaining NG. This is usually the case when the NC iq a DEGDN propellant is of considerably higher nitrogen content than that used in a corresponding NG propellant f) The huming sace of the German 2:0 mm rocket propellant was given equal to: -0.35+(29.4×10 P) while the corresponding value for the standard American double-base 7/8 stick propellant is: 48,6×10 P. This means that the rate for the American propellant is about 65% greater than for the German propellant

g) Experimental procedures for the determination of the burning rates of propellance are described in Pic Aten Tech Rept 1235 (1943)

il Methods of computation of properties of propellants are given in the Du Poet Burnside Laboratory Memorandum Report 31.

o) Deiglie (Digirkel Röhempelver) was used in 37 mm AA gaus, 57 res. A77 gams, 42/22 mm uspens-bee gam, 50 mm A72 gams, ang 77 5 mm Anny gams, and 28 nm 105 mm, 128 mm, 149.1 mm Navy, 130 mm Anny, 172.6 mm Navy, 130 mm Anny, 172.6 mm Navy, 130 mm Navy, 130 mm, 13

star shell amon sua shell amos

E. Mirrepumidine (MGu) Propellant, designated GuP
(Gudolpulvar), existed in the following varieties:

a) Gudiff (Gudol Blattchempulva) was used in 50 mm

in many suc 33, 150 am heavy howites: 156 am heavy heavy howitzer for forcification;

b) GeRge (Gudol Ringoulver) reas used in 210 no mortact 18

To compete the control of the contro to overcome the by proscopicity

Table 47 gives composition and some properties most cosmon artillery propellants used during WW II the Germans- (See following pages),

Propoliums, internal Balliotte Date is given intables at the end of CIOS Report 31-68 (1946).

Propolients, Rocket, See Rocket Propolients

Prepallents, Stability of The ambility characteristics of some German propellages were determined during VW II at Picatinay Amenal and described in Technical Renort 1456 (1944).

in cases where sufficient material was available, both the 120 and 134.5 Heat Texts were made. The results 'of teats showed a tendency toward greater asability for those propullants which contained a stabilizer-relatinizer (such an centralize) in combination with another archilizer. such as acardite.

Sufficient amounts of propellants were not available for exacting a definite conclusion concerning the merits of disubstituted prethenes in combination with acadite-Propellants rootsining NG, DEGDN and NGo-DEGDN proved to be of auta-actory sentility, judging by the 120

Heat Test of the U.S. Army (the test paper should not turn a salmon pank color in leas than 40 minutes).

As m the suggle-base propellants, only a few of the German properience met the U.S. Ameri-Specification which requires that the treet paper in the 134.50 Heat Test saids not rum salmos punk in color in less than 45 minutes.

Propellers Charge in Fixed and Semi-Pixed Assumption. According to E.Englesburg (The Ordnance Sergent May 1944, p. 21), German propelling charges may be abditivated into two main classes:

s). Class No 1 (Fixed round) used flaked and mining propellanm. In this case, the gruins were packed in a silk bag with an igniter bug sewed to the ead facing a SILE Deig with in (Saiter Prg sewed 0) the end facing the primer. With subsing grains, they could be either packed in a silk bag (as above) or tred, in a buselle by means of a fine venue. The lower end of the bundle of tubes was placed in a more silk bag, which had sewen in its Docom, a roarser silk bag containing

ignies composition
b) Class No 2 (Semi-fixed round) consisted of base and increment charges (zones) contained in aille bags. An ignirer bug was sawn to the base charge. The charges were shipped inside the cartridge case and if there were too many increments for the desired range some or were too may increments for the desired range some or uli increment, but not the base charge/outle be removed; deviced thing) and aubstituted by the "instance piece" of v. b. in a paralboard pr. seenli container, was provided. in a paralboard pr. seenli container, was provided. Some propelless charges had a bay with a finals reducing agent (which was placed becreen the propellate; and pre-jectile) while others had a decoppering agent such as lead was warped account the lag.

Propollent Grains and Thele Dimensions. The following typical German propollents are listed by H.H.M.Pike in ClOS Report 31-68 (1946), pp 4-5 and tables:

and 0.6 mm much

and U.5 num cure; c) Flake, (Blatcheupulver), designated am BIP (3 x 3 x 0.8). consisted of grains 3 mm long, 3 mm wide and 0.6 mm thick
d) Diac (Plattchenpulver), designated as PIP (50 z0.2), consisted of discs 50 am in diameter and 0.2 mm

e) Ring or ensular (Ringoulver), designated as RgD (0.2 x 50/10; consisted of grans 0.2 am thick, 50 mm in diameter and a central hole of 10 mm in diam

Noise: Due to the difficulty of ignating propollants containing DEGDN and NGs, the ignitera for these materials consisted all NC of a high degree of situation with not more than 5% DEGDN.

f) Nodular or moodle (Nudelpulver), designated as NP (or NdP) (1.5 x 1.5), consisted of grains 1.5 cm

ner tor rotr) 11.5 x 1.5), cobaisted of grains 1.5 cm long sed 1.5 mm in diameter.

1) Long (Languairer), used for Naval star shells and ceipspared as Lg? (480 x 3.5/2.8), countated of mbolar grains 480 mm long having external and unterval diameters, of 5,9 mb and 2.8 mm respectively.

grams our mn iong naving external and internal diameters.
of 3.0 mh and 2.8 mn respectively.
(See also Table 45 of this book where web dimensions and ballistic characteristics of typical German propellants are given).

Propollant Ignitors and Propollant Ignitor Bag Compositions. According to the work conducted at Picatiany Arrenal during WV II most of the base (containers) used for propellent igniter compositions were made of colloided amokeless propellest meterials. The same inventigation showed that the propellent ignites compositions may be subdivided into chree classan:

a) NC-NG composiziona (

b) NC-DEGDN compositions and

e) Black powder compositions,

Table 48 gives the composition of typical propellent ignicers, classes (a) and (b), and of their containers (bags). It is to be pased that the values thall be considered as only approximate because there was a possibility that some of the NG or DEGDN volatilized and passed from the propellant to the bagos vice versa. (See servious page).

Some propeitant igniter compositions of Class.c (black poroses) are given in Table 49

## Propoliont Subattrutes. See Treibentue.

Proving of Assessation and Woopens, Preliminary testing Praving or Assumation one Wespean, Pratissinary testing-was fonce as proof-ranges, sainched to meet of the explosives, -amountaine or wespean placks such as those of the Dynamic AG, which was the proposed placks from the saince (acceptance) to the contact of the saince of the saince (for the Army) or at the Mappen (for the Navy) Powing Grounds.

Nost of the German proof ranges were built in the form? of a V, the gas being placed at the point of intersection, so that it could fire into one butt while the other was being prepared. The officer to charge use in an upseuser office behind the sun and overlooking at. The LeBouleage chronographs were in other buildings further back and results were sent to the officer through a pipe conveyor system. The LeBoulenge screess were usually placed 10 a

system. The Léboulez & extreme were usually placed 50 a apart at apprentantly 10 and 70 m from the gas.

In grood procedure for a propellant was to fire at its comparison with a standard propellant, using 7 records on the comparison with a standard contail but was 30 come. The firing to supersture was 10°C and to was 30 come. The firing to supersture was 10°C and the comparison of t Chamber pressures were measured by copper cylinders

(creaper gages). (crusher gages).

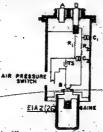

The proof procedure for a gue was to heat a Service propelling charge to 35°C and use it in the gas being proved, attempting to develop a pressure (design or true pressure) of about 300 stm (sq tons/sq is) shows the proof pressure, an measured by a copper crusher gage. For the Adolf gun the pressure above the proof pressure, was only

150 sim(1 ron/sq m). Reference: H.H.M.Pike, ClOS Rept 31-68 (1946), pp 10-12.

Prinzini'ly Fuzu. According to Til 9-1985-2 (1953), three expec of proximity haze, for use in bombs, were developed in Germany; the Acoustic, the IR (infra-red) and the Electron

ic.

Among these the Krenich (briefly described on pp 216-17)
was accusate, the Medrid (developed by Kapka of Vienes and mentioned on p 232) was infrared, and these were also electronic fuses developed by the Telefuntes Co and others. Several other names of proximity fuses are mentioned on p 229, such as Kekedu, Marcho and Fusha, but the type of such of these was not stated.

A different type of proximity fuze is described in TM Ey-1989 (1942). File N 2322.6. This book designant. as ElAZ (26), was tribindical in shape and contamed the charging plun gers A and B (autrounded by insulating material). a chatgar-conference C1:10 filing-condenser C2 , resistances
R1 & R2 , as igniter bridge IB, a trembler novech TS and an air pressure switch. The latter switch consisted, of a fixed and a movable place. The awarch was placed punt inside of an opening in the fuzz case and was aligned with the air rube leading from the nose of the humb C250

Flam. (See drawing).

The base of the lune case was threaded to receive the game, which housed the primer (containing a match composition and black powder), the detonator (containing lend and de/lead styphnate mixture over PETN and PETN/wax) and the booster (picrie scid).

Before the bomb was dropped from a plane the current from the plane batteries passed through B (planger A was a dummy) into C, and at the release of the bomb the current a dummay) into U., and at the resease or the motion the current leaked showly through R; to C; where it accumulated. An the bomb approached its target the pressure of air, and the true leading to the pressure switch pushed the inovable place of the switch towards the fixed place. movement prime of the awaren commons the riked plate, thus clossing the execute through IB and fixing the game and eventually the mans charge of the bomb.

If the pressure tuse should fast to operate then the

trembler switch TS was supposed to act on impact come.
Note: According to U.E.Rogens of Picatiany Arsenal, this
type of fuze could be initiated by the air burst produced by other bombs exploding in the vicenty and this would be undesirable if the bomb was not yet close to its carget. On the other hand this property of the Juzz could be used to intentionally produce our burets of bodies by dropping

Premimity Fuze, Electric, ELAZ (26), Sen under Premimity Fuze. Pudal (Pandle). An acquetic homing device intended for the control of some guided missiles, its construction was essentially the same as for the Eignich acoustic proximity

Pulver (Powder) - See also Propellant,

Following are the principal German abbreviations used to designate various types of propellants;

s) Pulver Digl (Typ Digl). A double-base propellant

coneg as principal ingredients DEGDN and NC b) Pulver Go (Gudel). A triple-base propellant con-

eleting of NGs, NC and DEGDN c). Pelver Nel (Typ Ngi). A miple-base propellant

consisting of NGu, NE and DEGDN d) Pulyer No (Typ Nz). A single-base (NC) propellant

e) Pulver OL (Pulverjohne Lösungeminel) A solventiese f) Blitrehampulvar (BIP). A leaf- or flake propellant

g) Ringoulver (RgP). An annular propellant, conembling 6 Washer

h) Rührerpulver (RP). A tubular propellant i) Streifengulver (StrP). A strip propullant

j) Worfelpulver (WP). A propellant in small rectangular tablets; it is called! sometimes | cube-cut propallant. Reference: Tis 9-1985.

Pulvernouse G . A double-base propellant containing K oulface as a flash-reducing agent.

Pulvemerellurgie (Powder Metallurgy), The technique of powder metallurgy was applied on a considerable scale during WY II, chiefly in the production of carbide tools and defining www ii, caseziy sin one production of carrows cools and some ammunication and weapon components. For instance, the following astrictes were manual from sintered iron or streel whell driving bands ranging from 20 to 210 on in calibra-tical bands are some street of the control of the con-street of the control of the control of the con-trol of the control of the control of the con-ponents, BIOS Final Rept 393, them 21 (1983).

notellurgle (as practiced by the DPG). A jet of solves som together eith a stone jet ol-ser vers andere som together eith a stone jet ol-ser vers affected againet. A fast totating horizontal diec enclosed in a cylinder having a consist-form provided with an entire. The trauling-product, powdered tros slightly onthest on the surface, was disced with a small amount outdissed on the surface, was disacce with a sensit amount of yellow lead outde and give reduced in an azimosphere of yellow lead outded and give reduced by this process the son particles became outdoor. By this process the son particles became outdoor was used for the preps of sarriers and other nest-prior. This prouder was used for the preps of sarriers and other nest-prior of the property of sarriers and other nest-prior. Private commonication.

Pulwitt of Serlin passented, in 1895, the following permissible explosive: Am nitrate 92.0, phenanterene 5.5 and K bichromate 2.5%, | Daniel, Dictionnaire, Parts (1902), p 659 1.

Puppehen (Dolly), called itse Wheeled Boroske was a carriage-mounted 88 mm stocker launcher with breech-block it used amountion containing the same shaped-charge warhead as the Ponters threek (Olonrohr) but with a shotter rocket motor body, it was fired by means of a propellant contained in a castrage placed in the breech. The flash from the carridge smited the rocket propellant and the missile proceded towards the target Reference: Intelligence Bulletin, March 1945 p 14 (See

Pyrofulmia . See general section,

Pyrolit (Pyrolithe), According to Naoum (821 1) Pyrolit. was a type of explosive prend from smokeless propellants left over after will. The finished product also, contained 5 to 12% gypaum and ht least 18% moisture. Pa nitrate and/or K perchiorate (max 30%) and TNT (max 15%) were sometimes incorporated in Pyrolit.

J.Pepin Leballeur (Ref 2) lists the following con positions, called pyrolithes: a) Ballistice 74-76 and No nitrate with or withder

KC10 26-24% b) Ballintite '40-42, K chlorate with or without Na

nitrate 45-43 and aromatic nitrocompounds 13-15%. Note: The aromatic nitrocompounds of the last composition. should not increase the sensitiviness to short to say extenter extent than the addition of 13-15% TAT. References: 1

(40)50) 40, wood mean 3, ju was non termine the mind 3 manters and the mind 3 manters (53); K nimitice 8.00, Al 273, S. 4.0 mind 5 manters and every limit 10,700, Benning time 5 matters and every limit 10,700, Benning time 5 matters and of the intermediate and the limit 10,700, Benning time 5 matters and the mind the mind 10,700, Benning time 5 matters was character for all flarms, bas the inpution companitions were as follows:

For green flarm: 17 g of a minter of Ben niverse 60, CPV C73, Mg 14, 10 man 1 ond vandiline 279.

For yellow and within flarms: 17 g of a mintere of Ben niverse 62, Bel limited 6, S 10, Al (lakes) 10 and niverse 63.

At (grains) 1%. The curtridge for the green star consisted of the following

The composition for the first star was: Sr nitrate 60 Mg 24 and CPVC 168). The first fire was the same as for the green star, but the intermediate contribued: Ha nitrate 31.2 K nitrate 15.4, At 10.9, S 11.7 and black powder

20.8% Note: of the intermediate compositions containing black powder and sulfar, were replaced, in 1945, by minutest costs triganisecembasels, K signate and Ai and the reason for this 1s exclaimed moder Termaiwocaebasel (TeNCbs). (Kuskada) Parranan (Gascade Cartridaes)

commined flares (green, red, yellow or white) without

parachutes.

The following combination was used for green flure:
a) lgniter() g of black powder)

12 d and missure of K nitrate 34

b) Intermediate (7.5 g of a mixture of K nitrate 34, TeNCbs 34 and Al 32%.

7 Green flare [520] g of a minimum of Ba airman 61, CPVC (65% Cl) 21, Mg 11 and IG was 7%] Sauraing time 2 minuses and cardlepower 100000. Note: The composition of the red flare was: Sa singuis 62.5, Mg 153., CPVC (63% Cl) 18.0 and IG was 6.0%. Burning time ? minures and candlengwer 10000.

3) "Rx" Rough Petronon (Snoke Carridges) counsined three snoke cradles (Nebelhersen 398) consisting of a mixture of HCE 40, Zn-dust 50 and Ba sittate 10%. Buming time I minute.

4) Black Smake Costridges, which contained about 500 amoke producing pellets of the following composition: HCE 61.5. Mg 18.5. methracese 8.0 and applitudence 12.0%. The ignites train consisted of a black powder and so ignition composition continuing K sitted 24.0, HCE 24.6, TeNCbx 18.0, unthracene 5.6, unphthalene

2.4. Al powder J.S.O and Mg powder 7.4%. Act. As powder 35.0 and ag powder A.5...
Act: There were two types of 15 cm RSSG nockets (1 and
2). Type 1, was equipped with a delay ignizer V-22 (q v )
which was lived by the hot games from the propellant,
while type 2 was equipped with the electrical ignizer for the rocker motor tube and was ignited separately.

"B, 13 cm RL 05 (Raketen Leutdrawsk Schlaggruchous Rocket Humidain, Simulating Davics ) was an improved version of the 15 cm 48556 rocket. The RLGS rocket used lame of the tollowing types:

Hame of the indowing types:

1) Single rolps fines: fed, green or yellow

2) Red, green and yellow filters which bout 2) seconds.

For, instance, the green fines: carriage constanted of
the following inems:

a) First him (1) of black powder)

5) Intereseding (3.5 g of a mixture of TeNChe 30, Al 30 and K nitrate 40%) e) Igniorr (20 g of a mixture of Be nicrate 60,Mg 20 and PVC 20%

and PVC 20% d) Green flore [1.15 kg 5/ a mixture of Ba nitrate 57.5, Mg 7.5, Mg/Al niloy (50/50) 6.5 and PVC 28.5%.

Bitming time 4 mustures ].

Bitming time 4 mustures ].

Per litares which hursed, with the ejection of surer; the composition was not the mane as for ordinary filares.

For instance, the green flam, employed for ejection of stars contained: Ba sicrace.53, Mg 25, PVC 20 and graphice 2%. The corresponding stars contained: He nitrate 55, Mg 18, PVC 25 and graphics 2%.

The composition of other flares and their stars in given on no 27-29 of the Reference

C. Merk 50 Keskede (Cascade Flare Boothwas employed to moniate the tascades' of the Pathington system assed by the Allies, it consisted of a cardoned case filled with about 67 randless. Each candle barned for about 2 minutes with sither a red or green flason. The composition minutes with sither a red or green flason. For composition X-Ke" (Kaskado) Patrones and destribed for item Al-Natewistons: CPVC Chiomisate Johyson Christian (Patrones CPVC Chiomisate Johyson Christian (Patrones CPVC Chiomisate Johyson Christian (Patrones Charles) (PVC Polymylchelmet; PRCE Teramine-cahana).

PYROTECHNICS - (Fenerwerkerei). The compositions of various pyrocechnic devices in use between WW I and WW II were given by Langhans (Ref 1) and Lenze (Ref 2). The latter investigator also described various tests applied to pyrotechnic compositions, such as Entzindlichkeit ( (ignitability), Entzundungstemperature (ignition Temperneure, bertredtrebrett gegen Schlag und Reibung (Sen.

situreness to Shock and Friction), Detonations gretch windig keit (Velocity of Detountion) and Brisanz (Stiannee). A brief historical description of the development of

the science of pyrotechnics to Germany is given by Lotz (Ref 3). Maro (Ref. 5) lines numerous German pyrotechnic

projitione on tan be seen in Table 30. (See next page).

a) Detection of flame for a 12g scar signal was about 7 seconds

b) Fir igniting each star composition of the signal about 1 g of black powder was used. This in turn ignited about 1 g of the intermediate mixture containing K nitrate 30.6, Be nitrate 39.1, carbon 9.2 and Al 21,1%.

to the article by Goldenson and Dannet (Ref 4) the following compositions are luxted:

A) Hand anaka alamaks a) Red: K chlorate 17, Inctone 24 and o-methoxyphenylazo-bera-ampthol 59%

b) Blue: K-chlorates 30, Increase 20 and 1-methylc) Greent K chlorate 29, lactore 24, 9 10-dissilino

anthracene 30 and 1-methylamina-4-p-toluidinosathraaujaque 26% (Adda to 99%)

d) Violet (Rnuchbindelpntrose Vidlett): & chlorat 25. 1 methylonino-4-p-toluidinonnthrequinone 45, luctone 50 and "Rhodamine B" 10%. It was fired from a Very-type pistol to produce four streaks of , bright violet smake.

B) Whistling cortrides (Pfeispatione) Contained ewo minamere

a) Be nitrate 55.5. Al powder 35.5 and sulfur 9% b) K chlorate 63.5 and gallic acid 33.5%-(Adds to

None: Mixmee (a) were for producing light, while mixture (h) produced a whistling sound. The cartridge was designed to be used as a yes attack vacaing.

C) Frangible grounds which produced a white screening ampke by the hydrolysis of titanium tetrachloride with water in which was dissolved 27 perts of Ca chloride (to prevent freezing) D) Tank-nun amoke-acreen projectule which contained

oleum adsorbed on pumice. Another Projectile was fill ad with solid SU ..

Additional information, given below, was obtained from Refs 9-17: A. Pyrotechnic items of Ref 9 are discussed in this work

under incendiary Compositions and Snoke Compositions. a) LC 50 flares, 8" diameter

b) Ground flates 4.5" diameter

c) Self contained signal rocket d) 2 star red signal, hand operated by a pull igniture. C. Prestechnic stems of Rel II are discussed to this work under Syrotechnic Antipathfinder Devices. D. Printechnic stems of Ref 12 are discussed in this work E. Pyrotechnic items of Ret 13 include the followings

n) Compositions for the different colored candles used in Mk 30 haskade Bonke include Red: Sr niwate 36. an Mr. 50 American normal statute. Red: Sr nitrate No. Mg 16, Igelit 21 and 16 gent 75; Green: Ba nitratife No. Mg 16, Igelit 21 and 16 wax 75; Vellow: He nitrate 16.5, Mg 15, Cripalite 8,5, IG was 4. Igelit 6 and Caosalate 57; White- Ba nitrate 59, Mg 11, Konstane 21. IG was and and gelit 3

b) Flare composition used in the ground flare, Bodes-levekte (P) #756277; kg (granalio) 346, Na sizzas 11.3, 12.5 km sizzas 11.3, consistent of the sizzas consisted, of Nav sizza composition near the ship sizzas consisted, of Red light composition for ship sizzas continued it Red light composition for ship sizzas continued of Red light composition for ship sizzas continued processition of a safety of pistols, etc. A upical cap composition of a made by mixing K chlorate 70, Monaphoras 10, Prosecution imms of Red 17 lands/s the sources' (a v) and some flowest compositions such as Bengal upit and was the compositions.

H. Pyrotechnic issum of Ref 16 include the following red colored light mixture used for atgnatling: Se nitrate 30-61, Mg 17-35, polyvinyl glionde or chlorimated paly-yaryl chloride 14-28 sed vaneline or synthetic war 1-38. L. According to Ref 17, the Germane made arent nee of kieselgahr as so extender for expensive organic dyes and aye intermediates used in their pyrocechnic compo-sitions. Kalestoncomi

## Quellingsgrad Swelling Coefficient). See weneral section.

R-Mi. A 2 inch solid propellers rocket, which carried about 1 ib of a HE and had tail surfaces that bledd be looked back. It was mass produced towards the chil of folded buck, it was mass produced lowards the each at VW II. by the Destacks William and Massacrossishiles at Lisbeck. As many as 48 of these cassales could'be casted on the undersume rocks of a lighter plane and lime? Perceivally simultaneously against a bomber formation at Wanage of 1200 to 1500 paried, it was claimed that a single hit with such a rocket was sufficient to bring down a bomber.

Reachig's White Powder (Veisspulver) (See also Reachis) A cheap blasting powder prepared by E.Raschig in 1911 as follows: A concentrated solution of a mixture of 65-70 pater

of Na nitrate and 33-30 parts of Na cresologiantes was run in a thin stream onto a rapidly recating dram beased by high pressure steam. The thin layer of dehydrated material which formed on the surface of the drum was accepted off in the form of linkes which were packed in waterproof paper cateridges. Composiziona parenced in 1912, consisted of: a) Na nitente 68 and

"Zellpech" 32% and b) K nitrate 70 and Zellpech 30%. Note: In selecting the components of such explosives, it was necessary to bear in sand that if their solubility in not of the same order there will be a tendency for the ingredients to separate during the evaporation.

"Zellpech" is a pitch obtained by apporating the liance from the sulfive cultulose industry.

(Rottweiler Celluloue Pulver) (Rottweil Cellulous Propellant). The first German gelatinized malitary amokeless propellant which was invented in 1885-1884 by Carl Duttenhaffer (born 1843, died 1903) independently of P.Vieille who invested Poudre B (see in the French Section). The first RCP was prepared at the Rosswell Plane by nursuna partially carbonized wood (the same kind as was used for prepa of brown powder, called Pulver C/82) by a method similar to that bee'd in prepa of Schultze's Powder. The sitmend product was stabilized by boiling water, then dried and existinized by means of ethyl accusts. The gelatialized product was grained either in the form of small

icaflets (Blattchenpulvet) fot use in tifles or in the form of strips (Streifenpulver) for use in cannons, References:

Ger 156

Recoilless Gun (Kanone ohne Rucklauf). Several models were developed in Germany between 1937 and the beginning of WW II. Most of these were of Rheinmetail - Borsig Co design. One of the best known was the LG-1-Rb (later designated as LG-40) which was a 75 mm gun with a range of about 6800 yards. It weighed 325 lb (complete), was 45 inches overall and had a barrel 29.5 inches long, it used the Rheismetall horizontal sliding breechlock which carried the counterblast nozzie, .

The larger caliber recoiless guns included

a) 105 mm, known as LG-2Kp and as LG-40: This had a breech system very similar to that in, the Russian recoilless gun which was developed before the Russo-Finnish War. The German model weighed 850 ib complete b) 105 mm, known as LG-2-Rh, LG-40-1 and LG-40-2, which used the Rheismetall breech design, it weighed 1200 lbs

c) 155 mm, designated in service as LG-42, weighted about 1400 to in firing order and projected a shell weighing about 90 lbs

d) DKM (Dusen-Kanone-Marine), developed by Rheinmetall-Borsig Co, was made id two versions: the DKM-63, cal 88 mm, for use on light patrol craft and the siant DKN-64, cal 280 mm. These two guns were still under dr velopment at the end of the war, but the DK:5-43 was almost ready to be put into production. Both guns were supposed to use, the Rheinmetall horizontally sliding breechlock with counterplast nozzle

el Aircraft recolless weapons, developed by Rheinmetall-Borsig Co, included the Device 104 (a, 14-inch gun firing a 1500 pound AP projectile) and the SG-1 F3A. designed primarily to attack tanks from the air. f) DUKA 50 and DUKA 88. Two recoilless aircraft

weapons produced by Rheinmetail. Dara and description of these guns are contradictory and little is known in a) Rheinmetsill like-115 was a 55 mm waapon of very original construction. It was still under development

at the end of war The above weapons were briefly described by R.March.

Ordnance 38, 887-78 (1954), F.C. Haverlack, in Picationy Armenal Technical Report

1487 (1945), described a complete round of unfired hollow shaped) charge used in 75 mm Revoilless Gun, L.G-6b. W.W.Fahr in CIOS Rept 32-108 (1945), described the recoilless gun development of the Rheimmetall-Borsis Co.

Recuilless Mortor, caliber 2", was briefly described by h. Dorbberger, V-2, Viking, N Y (1954), p 270, its pro-jectile weighed 15 lb and the velocity 1300 ft/sec. The weapon was optically triggered by means of a selection cell. When the plane's selhoueste appeared on the cell. the round was automatically fired,

Recallless Waspens, Besides recalless guns and the re-collies mortar described above, the Germans used numerous tubular Tocket launchers, such as Panzerfaust, Ofentoht, Panzerschreck, Püppchen, Panzerwurfming, etc., which also were, acrectly apeaking, recoilless weapons". .

Riffe (Gewehr) . See under Vesposs-

Riffed Prejectile (Pre-tifled Projectile), Three such projeculies were described in TM 9-1983-3 (1933), pp 326-328, All of then had a rifled design which took the form of 12 longitudinal splines inclined about 5° and spaced about 50 mm spart. The splines were not machined from the main projectile body but constructed asperately on strips of steel which were then fitted into grooves cut is the projectile body. The grooves were undergut to provide necure senschment.

It is assumed that the splines were intended to engage in the rifling of the guni.

To the test of the projectile there was a copper or bimetallic driving band, the probable function of which was to act as a gas sen).

Two of these projectiles were used in the Railcoad Cannon 28 cm K 5 (E), while the unwoof the third projectile is unknown.

One of the projectiles [28 cm (280 mm)] was micketassisted. It weighed about 546 lb (fonded and fuzed, but without sucker ignition fuze). The weight of HE charge was about 31 lb and the wt of propellant 43 lb . The maximum range of the jun was about 53 miles.

Another type of 280 mm projectile weighed 362 lbs (loaded and fuged) and was filled with about 67 lbs of TNT/wax - 95/5, pressed in blocks in a cardboard conteiner (See drawings under Granaus and under Rocker

(See also Pre-cognited and Pre cifled Projectiles in the gen-

Rifle Grandes (Gewehrgranten); Rifle Antitonk Granades (beweltspenzeggmenten). The following types are buefly described in Refs 5, 2 & 3:

m: Small Ancienak Rifle Grenade (Gewehrpanzergranate) was fired from the rifled 30 mm discharger cup (Schieas-becher), which could be litted to most types of German rifles. The greende was constructed in two parts, the head and the stem (body) which was screwed to the head. The head was a scemicus steel tube, the forward portion of which contained a steel cone and the bursting charge consisting of 1,75 oz of TNT poured around the cone. Directly behind the TNT was located the PETN/wax exploder (suxiliary booster). The stem was made of a light alloy of aluminum and was provided with a pre-cagnived driving hand. The upper section contained the eagmwed-driving name. he upper section contained in gasse. (deconator-bookser assembly, and the lower section the printer sacembly. Total weight of the grennde was 8.8 oz., the overall length 6.4°, the maximum deameter 1 316° and the range 50 yds (Ref 1, p. 8 and 1. Ref 2, pp 334-5)

Rel 2, pp 334-5)

l Antisage Manner Rifle Grenndr, designated as
C Page 42, described in Ref 3a was similar in ap-pearance? to the one described immediately above.
The C Page 42 continued 49 g of 50/59 Cytolol as the bursting charge. Its beoster and auxiliary booster consisted of 91.4/8.6-PETN/Fax and weighed 12.7 g. Consisted of 71.475. We provided not weighted 1.1.1 g. The fute assembly consisted of an upper primer charge of 0.018 g of & chlorate 02, 5b suifide 30 and abrasive 8%, and a lower primer charge of 0.01 g of carbon lts detonator contained 0.33 g of 76/36 Lead anish Lead styphnate (upper charge) and 0.49 g of PETN (lower charge) (See general Section under Carbon)

The grande was propelled by a 1.0 g charge containing 96.5% NC (13% Nt. 0.6% diphenylamine and 0.1% amphite, the rest being organic impurities in NC, total volatiles, and water soluble substances. The primer charge consisted of, 0.028 g of a mixture of Be primer 16. Ph styphnate 35. Ca silicide 15 and Sh sulfide 4%. Total weight of the grenade was 0.325 ib and the premil length 6.36 (Ref 3a)

d Large Astitack Rifle Gregade (Grosse Gewernanzers smoate) | was fired from the same 30 mm discharger cup (Schiessbecher) as the small grenade described under (a). The head of this greends was inrger (max dien 1%). The length of the ensemble (head and stem) was 7°, the total weight 13% on and the ,wr of the

was ', the total weight 15% of and the wr of the diller (TMT) 45,000, he campe was 100 yd. The time and booster were similar to the greende (a) (Ref. i, p. 8 and Ref. in p. 157).

Of a streamlined bell-shaped body, with a slightly cover closing diec of aluminum, a graze fure which screwed into the base of the body, and a waned and and which accewed on the base of the fure and, was uset which acrewed on the basic of the fance and, was closed by a rubber play. The burstung charge consisted of cast Cyclonic/Was with a hemispherical, cavity in the head. The cavity was fitted with an aluminon the property of the propert and drove the pin forward causing it to cut the shearing pin away from its acrewed end. The pin was then ejected (by the spring held in compression under its head) and thus lets the striker which had been held away from the denounce only by the creep spring. On praing impact the treep spring and the detonator was pierced. The grande assembly was 9.3" long, the head 3.1" and its maximum diameter 2.4" (Ref. 1, p. 9 and Ref. 2. PP 337-83

A more detailed description, of the grounde in given in Ref 3c. The composition of the propellant was: NC (13% N) 96.5, diphenyla.nue 0.6, graphite 0.1. total volatiles 0.9 & organic impurities 1.7%, and of the percussicoprimer water soluble 0.2.86 natrate, 46,Ph styph name 35. Ca selicade 15 and Sh aulfide 4%. The weight of propellant 1.0g and of primer charge 0.026g. The burnting charge (34.1 g), consisting of PETN 88 and was 12%, was initiated either by the driction igniter or by the dethuness. The ighiter contained as the upp charge

0.020 g of red lend 74.7, silacon 17.8 and binder & fuel 7.5%; as the intermediate change 0.120 g of NC; and as the lower change 0.010 g of K perchinance 55 and as the lower enhage 0.010 g of K Perchlames 3, and Ph ferrographic 45°s. The Glay element contained 0.000 g of black powder and the flush element constant 0.100 g of 0.00°s. The deconance constant as the upper 0.100 g of 0.00°s. The contained of 0.00°s of 0.00°s

e) 37 cm Antimak Rifle Grenade, fired from a 3.7 cm Pak, consisted of a min-walled steel head of bulbous chape to which was attached a closed steel paper surrounded by a multi-perforated sheet steel sube to which six vanes were welded. The head was loaded with 5.2 lb of either Dinigraniling/INT mixture or with pressed Cyclorol consisting of RDX 62,3, was 2.4 and TNT 35.3%, its hose fure assembly (AZ 5075) 2/4 and INI 35,375, its hose bare aspectory (AZ 3977) constated of a primer detanant (with 0.31 g of leads azide as the upper charge and 0.30 g of PETR a lower charge) and a detanative bare twin 0.30 g of 0 f 69/31. Lead saide/Lead styphanate as the upper charge, 0.30 g of PETN as the lower change and 6.8 g of 50/10 - PETN/Wax as the booter, its base has of 50/10 - PETN/Wax as the assembly (BdZ 5130) consisted of a primer (containing 0-150 g or 41/30/20/9 - K chlorace/5b sulfide/Newsusy 0:300 g or 41/97/20/9 - K. Chlorase/30 sullide/Memmuy climinass/Glass and a binder matter, 0 0,050 g of black powder consisting of 37/15/12 - K siwate/charcasi/sullius/ and a deconstor-honosier (cons.got,050 g 59/3) - Lead azide/Lead syphanes, 0.00 g/sof PETN and 6.8 g of 90/10 - PETN/Faxts. The propoliting charge consisting of 217 g of NC/NG or NC/DEGDN mbulser profellant was codmined in a speel carmidge case. This charge was ignited by 4 g of NC granular propellant and a percussion ype primer consisting of 41.7/25.5/20.5/12.3 - K chlorate/Nercury fulminate/ 41.7/22);//30.5/14.5 - a culoracy mercury numbers:
5 sufficie/Abrasive and 0.5 god black powder (75.9/
14.7/9.2 - Knitests/Charcost/Suffici. The impact fune functioned in the case of direct impact, where she hase fuke functioned in the event of grass action. the base tune-tunctioners in me event of graze action.
Total weight of the grenade was 18,7 lb, over-all
length 12 1/8° and length of body 12 1/4′ (Ref 2, pp 335-6).
A more detailed description of the grounds is given
in Ref 3b

). Antipersonnel. Rifle and Hand Grenade (Gewehr-

springarmane, fried from a Mentiner Biffer over his propagation of the configuration body (5,5° long and 1.2° man dismesses) which propagate a barraing and 1.2° man dismesses) which propagate a barraing and 1.2° man dismesses) which propagate a barraing and propagate and a friction inplies (similar to 52° 43) intributed a character of the propagate and a friend inplies (similar propagate and a friend propagate and a friend propagate and propagate and a propa sprenggranam), fired from a Mauser Rifle Grenade Disof the mastle was 9 oz and maximum range 550 yd, (Ref. 2. pp 332-41

a) 46 mm Antimok Rifle Grenade (SS Gewehrpansergramate) consisted of a base-fused this walled steel sulbous shaped attenuitied shead (46 mm to diameter and 93 mm long), to which was attached a prerilled and yo man longs, to which was attached a prerilled cylindrical aceas 30 mm in dismeter, and 102 mm long, in hursting hollow charge consisted of 143 g of 50/50 m EDX/TNT which was astitated by the following devices: a fuze planner. [cong 01068 g of K chlorace 450,8 b suffice 430,8 and Hg Indimance 7.2%), a deconator (contg 0.33 g of 77/23 - Pb unide/Pb styphnate as the (contg 0.33 g of 17/23 "Po waide/Pb styphnate as the upper layer and 0.46 g of PETN as the lower layer), and a booster (contg 6.4 g of 94.5/4.5 "PETN/Wax mixture), it was propelled by 1.44 g of single-base propellant (contg 97.3 % on NC with a N content 13.2%) which was primed by 0.027 g of a mixture cost g ha The total weight of the granude was 13% on and overall length 195 mm (Ref 1, p 9; Ref 2, p 331 and Ref 3e).
h) 61 mm Aftutank Rille Granade (SS Gewehrpannergranate). This grenade was similar in construction, except for some dimensions, to the previous grenade.

GRENADES LEAFLET SE STEEL PACKING DARGTII CHARGE FILLES STAR PATOS THER RE-

The soral weight was 19 oz, overail length 238 mm, length of stem 102 mm and its diameter 30 mm, length of head 136 mm and its max diameter of mm. Its bursting and propellent charges, as well as an primers, demande

and plopellest charges, it went as an instance, neutrators of the plot of the previous greende. Its overall length was 244 mm, black of the plot of th was fired from the rifled 30 nm discharger cup (Schiess-bechet) which could be fitted to most types of German rifles. It consumed of a cylindrical steel body (with a pertiled base) containing a delay fuze, a thin cylindrical container for the passibilities and an electing charge for this cylinder. On frang the greande, the propellent gases ignited the delay fuze and, after about 9 seconds of delay, the fuze fixed the ejecting charge. The resulting dellagration blew off the cap and forced the leaflets out the nose, Total weight of preside 8 oz, overall length 5.7" and range 500 vd (Ref 2, p 338)

k) Illuminating Parachute Rifle Grenade (Geweh b) Illusinating Parachute Rife irenade (Geweh Pallachunio-Originane) consisted of a tinewalled Pallachunio-Originane) consisted of a tinewalled which housed the parachute and illuminating star. The rear of gerande contained two delay pellets and two spection charges. When fired the flash from the original period of the properties of the passe forced out the south of the container (which beld they parachute) and the start. At the sourt time, and time the properties of the p beld the parachute) and the start. At the same time, delay (2) was ignited and after it burned through (2 seconds) the ejection charge (2) became initiated. The resulting gases ejected the paracaute and the star toom the container and ignited the star, it was channed that distances up to 650 meters could be illuminated by this ame. (Ref 2, p 339) (See also Faustpatrone and Pigtol Grenades).

Roberts (Roberte). A type of permissible explosive patented by Rode about 1886. The earliest type counisted of Am nitrate 90 and dinitrochlorobenzene 10% It was claimed by the inventor that a nitrated chloro-compound gave a higher velocity of detonation and greater power than the correspondent nitro-hydrocarbon. The above Roburite was sensitive to friction; when ignited with a flame or a spark it burned without exploding.

Table 52 gives the composition and some properties of several Robustes (See sent column).

Röchling Anticoncrete Projectile (Röchlingsgranate 42 Betos, abbreviated as RöGr 42 Be). According to German photographs available at the Picationy Arsenal and Aberdeen Proving Ground Museums, it was a subcaliber shell which casefuled in appearance the "arrow projectile", except that instead of the fin susembly of the arrow shell it. had a discarding flange serving as a driving hand. The front flange acted as bourtelet. These projection were fired from regular guns, such as caliber 21 cm and 34 cm. The 21 cm shell weighed 193 kg and was 2.1 m long The corresponding characteristics for the 34 cm shell were: 913 kg and 3.7 m.

20 are brielly described the Rocket Assisted TakeOff Units, designated as RI 203 and RI 209.

The following necleasified Picationy Amenal Technical Reports describe some rocker-assisted shells which wore examined during WV II.

1) A.B.Schilling, 1604 (1946), 105 nm Rocket-Assisted, HE 2) A.B.Schilling, 1605 (1946), 105 mm Rocker-Assisted, HE 3) A.B.Schilling, 1606 (1946), 128mm Rocket-Assisted, HE 4) A.B.Schilling, 1607 (1946), 150 mm Rocket-Assisted, HE 5) A.B.Schilling, 1608 (1946), 150 mm flocket Assisted, HE 6) A.B.Schilling, 1609 (1946), 150 me Rocker-Assisted, HE

7) A.B.Schilling, 1610 (1946), 150 mm Rocket-Assisted, AP Rochet Somb Fuse Assembly, described on pp 169-71 of TM 9-198-2 (1975) operated as follows: On release fitnes the airmant the electric charge passed from the charging bend to the distributor and three directly to the bends face. Thee, after a delay the current passed on the

secket propellast' jamer. Dering the flight, the nocket was ignized and when the boarb hit the enget the impact lastinged die fuze, After a short delay (for penetration purposes) the burning charge was detomated.

Rocket Bullet, According to CIOS Rept 35-20 (1946), pp 6, 6A & 7, a 9 min socket minsile was under development during VV II by the Deutsche Volfere und Municionafalriken A-G, Lübeck, A denveng in emclosed in CLOS Rept 33-20

Rocket Louncher or Protector (Raketenwarfmarchine piles Varigation According to the Intelligence Bulletin, Was De-partment, Washington, D.C., vol. 5, No. 7, March 1945, pp. 1-9, the litest Gurman rocket Innachers were Schworns Verigorite 40 (heavy throwing apparatus 40) and lebweren Feriporer 41. Each of them could fire either 280 mm or 320 mm rockets weighing 140 and 196 ib respectively. The

The SRG 40 launcher consisted of a wooden frame (Warfgreitell 40) on which were placed wooden shipping castes containing rocken. The frame was inclined at

the desired angle and the rockets were fired directly from The SWG 41 laun her consisted of a frame of steel tubing (Burigestell 41) on which could be placed exther

The so-called Schwaras Warfrahman 45 (bear) throwing rack 40) consisted of a s sociated plates mounted on aides of an armored hal, muck (three on each side). The tocket carrying crates were secured to the places, and the larger then inclined at the required angle of furing, One of the most imp-titues rocket protectors was the 15 cm Habelwerfer 41 (literally "amone thrower"), nicknamed by the US soldiers "Squeening Meenie", nicknamed by the US soldiers "Squeening Meenie", it consisted of six grouved tubes, 5.9", in dispeter, mounted on a light two-wheeled carriage with 4 split trail. The crew of two men loaded the weapon, took shelter in a slit trench and then discharged the rockets (a six-mond salvo each 8 minutes) by semote control. The maximum range of these rockets was 8,000 rd.

Similar to the 15 cm Nebelwerfer 41 was the five-sube 21 cm Nabelwerfer 42 which fixed 8 inch fockets as (as 84 8,600 yd.

Note: None of the Nebelweriers, were accurate and for this reason they were not very suitable for launching HE rockets. Hesides using these launchers for rockets to lay down smoke concernations, they were also surable as projectors for gas-loaded (chemical) rockets. In both cases so accuracy of fire was required.

50 accuracy of lim was recounted.

In order to give their larger tocket projections greater and in the project of lines and our creame the accuratly of formation are considered to the surgical and the surgical

Dissanisfied with the slow rate of fire of the above launchers, the Germans in 1942 introduct a quicker firing weapon called the 15 cm Pennerwerler 12 (150 mm antiweapon called the 18 on Fonzewerier IZ (150 nm markant thower 42). It consisted of two smale of 15 cm. Nebelweder 41 isunching tubes (with ai), tubes in each basal mousted on an amorthed half-track. Since the crew the deep size of the size of the

following socket launchers used during we III.

a) A two-mmed cradle type launcher (or the Hs 117
(Hs 297) Schmetterling rocket-propelled missile (p 201)
b) A rail type launcher; (0 cm long (huge on the carrier
aixtraft) for the Hs 208 manufac (p 205) c) As inclined many type inuncher used for the Feuer-lilie F-53 focker-propelled guided missile (p 225) d) A launcher for the Grent Engran morker a maisted of two tron sails 6.8 m long mounted on a chanded

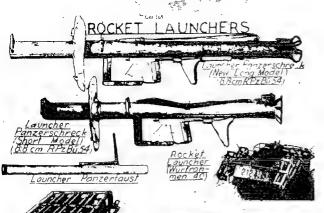

88 mm gun carriage (p 229) on mm gan currange to 229 e. A. ningle-rabe type launcher (Propognativerfus) for 7.3 cm Rakezengranne 41(p 234) f) A 35-frame launcher (Führsperit) for 7.3 cm Rakezengranner (p 235)

g) A multiple-rase ground launcher (Rokeren Vier act worker) for 8 cm Raketen sprenggrannte (p 237)

h) A single-barreled launcher, designated as 8.6 cm R Ag M 42, for the 86 mm flare rocket (R Lg 1000, or wire rocket (RDg 1000) (p 240)

1) A single nibe, two-wheel launcher (8.8 cm Raketyn-worder 43) for the 88 cm hollow charge rocket, designand as 8.8 cm R PzBGr 4322 (Raketon Panzerbuchse Granaty)

i) A usuglu-barreled inuncher designated of 21 on R Ap Maz, with a Berrel 1,12 m in length, used for the 210 mm rocket designalsed 21 cm RLg (p 259)

Rocket Layncher (26/3/2m Wurtgerat 41)

Louncher 15 cm Conzerwerfor 42

Launcher 'Do Werfer or Wurtgerät

k) A four frame launching stand (Wurlgerät) for the 780 nm HE rocket (28 cm Wik Spr) (p 251).
See also under Wespons).

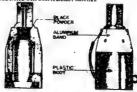

Rocket Projectile, See Rocket-Assisted Shell

Note: Rocket-aussisted projectiles were fired either from southers or going. For instance the 15 cm RGc 19 was fixed from the 15 cm well 13 themy tired howetizer to and the 28 cm RGc 453 was fired from one 25 cm A (§) endeading on 5). Sec FM 5-193-3, 193-5, pp. 949-8, 273

Recket Propellent, According to Listeniaks, Przenyst Chemeracy D' (4), p 40 (1948), towastast by Dr. Listeniak uncertainty and state propellents containing mirror listenia and stronglycern is these smaller modes, and the state of the state

was sufficiently freat, Water (vapor) and daygen served as driving forces.

Rechet Projection Lightime ERZ 29, burefly diversibled on ph. 623 of TM 91-095-51(915), littled into one of the vertical of the 15 cm and 21 cm rocketa, its body, made of a plastic with an alemanum hand sound the thouster, contained an ignited bridge from which man two wires. One wire was a part of the contract of the contract of the sound of the sound of the sound of the sound of the other to a need disk in the sound to provide the short of the other to a need for the sound of the

Rocket Properliest Inhibiting Conting. In order to prepare a settle of properties, see that it anough some from an end and not on the baden, the "Jaim was made that it was sufficient to cover the after of ents to take, by dipping is 'three into a special compositione developed at the Duneleys Fathel' of the Dynamit A-C. The 'composition consisted off nody visiplaceasts, 31' thropone t/mS > BaNO<sub>A</sub> 10, methylaceptate 5 and matter 40°.

Reference A.A.Swanson and D.D.Sager, CIOS Rept 29. 4 (1940), p 5 (As reported by Dr. B.Leunig).

Rocket Presidents, Liquid The following liquid rother propellants were used by the termans during We li-

a) Conten mated hydrogen peroxide and C-Stoff was used in the da 140B hatter Rocket (surface to air)

Note. Costoff & a 50/50 mixture of methanol and hydrazine hydrazine, N. H., H. O.

- b) Concen rated nitric acid and Vixol-to was used to the frazian E-4 Rocket, Rheintochter R-3 Rocket and hwssettall I ocket
- Note: Visor 6 is viny lether ether
- c) Concents ted nitric acid and Tonka were used in the Robinstahl 4-4 Rockes

Note: Tonka is a mixture of antiline, monocitylantine, dimethylantine, g softne, naphtha, methylamine and iso-hexylamine.

- d) Concentrate, hydrogen peroxide with K-permanganate was used in the Hecht Rocker
  e) Liquid oxygen alcohol and water were used in the
- y-2 Rocket and smerbite-55 Rocket
  Noce: The noncombustible substance, water, was incorpo-

Note: the noncomb titude substance, water, was incorpotated in outer to see the filam emperature as low as spesiole so as to reduc, the mechanics, strain on the motor without sacricipy is, o much performance, it was sound that the addition of 25% of water to absolute alcohol lowered the chamber emperature 7%, while the exhaudt velocity was sowered on 9.3.5%.

- f) Concentrated nate: acid, sylidine and triedylamine were used in the Schim-trerling Hall? Rocket

  g) Concentrated nate; acid and butyl other were used
- in the Inifun Rocker
- h) Compressed oxyget and gasoline were used in the V-1 Rocket

Note: In addition to these the following substances were used in liquid furth: squee, tethylideneaniline, ethylideneaniline, escetaldelyd napths, gasoline, dimenyimalities, escetaldelyd napths, gasoline, dimenyimalities, monomethylamiline, triethylamine, isoberylamine cec. in some of these liquid, sa, such as aniline, Visiold etc. pyrocatechol(Birenikatechia in German) was dissolved. Berlin (1926), pp 134 & 136.

Ribberspulver C/32 (RPC/32) (Tubular propellant, painter 1932). It contained NC 64-76, NG 36-57, Et centralite 1970, 197

Ribranguiver. C/38 (RPC/38). (Tubular propellast patters 1938). According to the Manual entitled: German Artillery Projectile and Fuxes, published during WWII at the Abendeen Proving Ground, Md. p. 183, the RPC/38 proprient was used is 150 mm HE Projectic, 4.5 calibers long, with point decompting have under ballistic cap. Although the point oxyments make under bailistic cap. Although the composition is not given in the above menual, it is easily to savene that the RPC/38 was one of the disthyleneglycoldisizes propellants developed at that time by Gallwitz (See \*G\* Pulved).

Referencese (Rew Propelient Mass, called also flaw Pastel. This was a mixture of water-wes nitrocallulose with an explosive oil which consisted of one or assural organic nitric acid estern, such as NG, DEGDN or TEGDN Such mixtures could be safely transported when the smokeless propellast plant was not located adjacent to the plants menuterrating NC and nitric enters. For instance, the Linemel Fabrik of 'D A -G manufactured NC and pressur acid enters, while the Dunneberg Fabrik, situated about 4 miles away, made the solventless propellants. As it was not safe or convenient to ship liquid explosives, the Krammel place mixed them with water-wet airrocelluloses propd by blending guncocron (Schienawelle) (Na13.15% to 13.7%) and collection cotton (PE-Volle)(Nal1.30 to 11.45%). sacked the mixture in rubbre-lined lines bags and shipped them to the Dinneberg plant to be used for the preparation of solventiess propelles m.

For the prepa of Robpulvermasse about 280 kg of NC (calculated on the thy weight), was stirred for about 10 minutes with water. About 120 kg of a nitric vater was added to the mixture and stirring was continued for 10 ainutes. The shorty was then transferred to a contribute where the water content of the mass was reduced to 10-15%. The resulting Rohpulvermanne was packed in rubber-lined lines bugs and transported to the Disneybers plant,

When received at the plant, the required number of bags were emptied into large drams, witter the contents of the bear were blended, the mixture was transferred to the prehented Werner-Pfleiderer kneaders. The other jouredients of propellants such as sub-lixers, graphite, Mg oxide, etc. were added in the kneader and, after allowing the blend to mature for about one week (two weeks for NGs propellants), it was passed through a hellical screw oreas in order to reduce the moisture content from 30-35% to about 8%. The partially debydrated product was fed to horizontal rolfs, diameter 0.4 m length 1.0 to 2.0 m and

rocating at 11 rpm. A temp of 70-80", was used for DEGDN powders. The time of processing was 18 to 30 minutes for a 15 kg sheet. Between 3 and 5% of mointure was allowed to remain in cannon propellants. The resulting sheer was trimmed to size and would on a bease mandrel about 134 diam. The sheet could also be used for the preparation of evenuted propellance. The extrusion should immediately collow the colling while the sheet is still hot. It was claimed that the inclusion of 0,25% MgO facilitated the extrusion. It does not neem that any wax was used for lubrication. The resulting extruded propellant contained 3 to 5% majorure and had to be dejed in stores to reduce the moisture to 1.0-1.2%. Reference:

Select Projectife (Treibspiegelgeschoen) consisted of a relatively small substaliber projectile carried in a relatively large casing (subot) of softer meterial. The larger was discarded as the projectile left the bore of the gua. The principle of this projectile une to have a large nuclace expensed to the pressure of propelling games and then to have the surface reduced no ties the air reaissance became small. These projectiles were sover very accurate.

One type of German sabot projectile was armor-prercing and consisted of a sintered tungsten carbide core and the softer sabot which was not discarded until the core began to penetrate the target (such as the armor of a tank). After this the core disintegrated, which chused a deadly

spray of fine fragments inside the target (such as a tank). Some, of the sabot projectiles, described in Ref 2, were provided with one or two discarding hands, each in one piece. They were fired from normal ridled mas. Some of these projectiles were called Disintegrating Rotating Bands Projectifest q v i. Referencest

Sanger-Bredt Minnile, called Antipadel Bomber, was a supersonic rocket designed by Dr. E.Sanger before 1942 but the project work was abandoned without any practical development. This design embodied many unique leasures. which are briefly described by Gatland on pp 57-8. It was planned to use the tocket in regions above a dense armosphere. Each time it dived and hit a denser layer of art, the missile was supposed to bounce upwards. These movements would produce a kind of wave-shaped trajectory, similar to that obtained when a flat stone to received across water, but much less prosounced. As each plus ge into a denser sir would result to a partial loss of kinetic energy of the manie, the instally long jumps would godbecome shorter, finally to be transformed tuco as even gliding flight, it was presumed that this method would achieve a stable flight and a more accurate trajectory to a segion above dense are, where conventional mightles usually behave temer ematically. The rought was designed to be campult launched and to be propelled by an oil liquid oxygen marute, its calculated characteristics were: aunching weight 220,500 lb, overall leagth (less bonates) 91,8 ft, width of rectangular section 5,9 ft z Il.8 ft, maximum mage 14,600 miles and maximum altitude 93

Schnellminn. See Panzerschaellmine under Landminen.

Schnellzeitzünder (Quick Time Ignirer), called also in-

Sebnellzeitzünder (Quick Time Igniter), called sice Instantaneous Fuse und Quickmatch. Some German igniters, such as Domnerumder und Eschbechzünder are described in Beyling-Drekopf, Sprengstoffe und Zündmittel, Berlin (1955), p. 229.

Schnorkel ader Schnörkei (Misspelled North-German word Snorkel oder Snort, messing Nose). The Dutch had fitted their submarines with an air intake back in 1940, and the Germans modified the device and called it Schnöckel. It consisted of a tube (about a dozen meters long), one end of which was connected to submarine Diesels, while the other end protiuged above the surface of the water. The tube was divided lengthwise into two compartments - one for suction of an from the outside and the other for removing the games of combustion of the Diesels. This device permitted the submarine to operate its Diesels while temaining in the submerzed condition, in case of denter, the Schnörkel forded horizontally and the supmarine submersed to a depth of as much as 700 m (or even 400 m. as was seported for the Submarine 211. As the married of the Schnörkel was usually non-metallic, it could not be detected by today.

Due to the fact that the Schnorkel used during www index an supply as amount of air sufficient to replace all the found are an aubmatine, 2.2 was necessare to resurface the submatine after several hundred kilometers of underwater travel or equivalent distance. The maximum achieved in an unmaterupted endowinged cognition was 500 km.

Schools Elindor (Provision Type Igninet), files called Mebel-ulleder (Lover Type Igninet) is briefly described under Igniners and is 14, 9-198-2 (1953), p 296: it was used in the Glassian 43 as a allerative to the Buck ignine.

Scholer Palver (Schuler Powder) - An explosive patented in 1893: K chlorum 60, pulverized anthractor 25 and augus 15%. A similar explosive was used by the British under

the same Schindler Powder.
Reference: Daniel, Dictionnaire, Paris (1902), p 705.

Schultus Pulver (Schultze Propellant). A smokuless propellast prepdiabous 1865 by Major Schultze of the Prunnian Artillery, by nitrining purilied (de-reninated) wood (in the form of small square-cut pieces), followed by washing and builing the spaulting Nitroligaoue with water and then drying. After this the grains were imprepated with a a concentrated solution of saltperer with or without Ba nitrate, and deied ugam.

Although this propollant was appreciably alower burning than earlier-smokeless propellants consisting of straight comprehend nitrocotton (anch as Von Lenck Propellant), it was still too quick for use is siller, akhough quiur anizable for abotems.

Schultze propellines was manufactured not only in Germany but also in England (1868) and Austria (1870). but it did not achieve may success until it was modified in England by Griffiths and in Austria by Volkmann, The Anatrine propellant was made by parely gelatinizing the Schultze propellant with a mixture of ether-alcohol and it became known as Collodin. The British modifications beginning in 1883, contained nitrated wood pulp instrud of previously used sittated wood. The composition of the British sporting Schultne propellent is given in Marshall (Ref 1, p 327).

The composition of German Scaulter propellant given by Branswig (Ref 2) was an follows: collodion cores 40. guacottos 40. Ba sitrate 10, vaseline 8, moisture 1.5 and gelatinizer 0.5% References

Soohund (See Dog) (Chica de mer in French). The "packer" submarine (16 tons) with a radius of action of 500 km invested near the end of BW IL Its crew consisted of 1 or 2 men and it engried 2 torpedoes, it was provided with a small Diesel, generator, storage batteries, electric motor, oxygen tanks, and so arrangement which allowed is to submerge to as much as 10 or 60 m. This was an effective weapon which could do considerable damage if : used in large numbers.

In addition to the Seebund there were two other models of pocket submarises both propelled by electricity. The our, mightly larger than the Seehund, was called Maich (anlamander), while the other considerably smaller, were colled Blber (beaver). (See also U-Boot, 'Ope-Man).

\$M-Solu. The term used for RDX (Hexagen) prepared by the direct attraction of hexamethylenesetramine as described briefly in this section under Hexagen.

Steherholtsdynamit (Safety Dynamits), According to Suppbacker, Spreng- and Schreseroffe (1948), p 86, the dynamices which are safe to handle and transport are called Handhelongealthers and those of them which are safe to use in cost mines are known as Stwherholtsdynamity. The latter dynamites contain 20-25% of h 3 (or a low-freezing mixture of NG and nigrostycol-4/1 mixed with discreptions hydrin which serves an a phlegmatiner) and a "dope", such as Am nitrate, wood neal, etc. If the NG is phispmatized by means of collection corror, the resulting dynamics belongs to the Gelutinedynamite.class, such as the Ammungolutina. Neur in countries other than Germany, for example France and Switzerland, arometic nittocompounds, such as DNT. TNT, esc , were used as phlogmatizers in lies of dissitrochlorohydrin. Such dynamites were known as Hitropolotics dynamités,

(See also under Swize Explosives).

Sichundstuprengetelfe (Safery Explosives). According to Secribacher. Spreng- and Schienatofe (1943), pp 86-7; explosives under this mane were allowed to be tamported by rul. They contineed 20-00% Am niquite and spit more than 4X NG, the remaining being word medil, acconstitutive compounds, see. Daser explosives, known also may Ammonalphrengenequielfe were pulvershoot, very insensitive to impact, fairly unable and difficult to ignise. Spotting Projectific (Schasabeobachtungsgranate). projectile serving for observation and adjustment of artilley live. It contained a small charge of amoke composition in a separate container inserted in the high explosive

The following projectiles are described on pp 409, 494-6, 500, 529 & 533 of TM 9-1985-9, (1953)): B AZ 25mAl (gr. a) 75 man HE Projection (7), cm (gr B AZ 25mAl (gr. a) 75 man HE Projection (7), cm (gr B AZ 25mAl (gr. a) 75 man HE Projection (1953); and 1954 of gaine of the PETN booster (GeZdlg C/98 Np) was located a small charge of smoke composition (on b) 150 am HE Projectile 19 with Gaine 16 (15 cm Ge 19 aZdig 36) for Heavy Field Howitzer 18 (aFH 18).

it contained 11,22 ib of cast TNT as a burning charge and a small amoke charge directly under the booster.

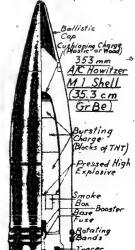

Total weight of projectile was 95.7 lb. Two types of point detonating luxes were used: AZ 23 or DoppZ s/00. The base was provided with a screwed-in plate (np 494-5)

Cer 1.10

et 150 ma HE Projectile al Cast Steel (15 em Gr 19 Stg) for Henry Field Howitzers (sF): 13 and sFH (8) and for Heavy Tustes Howstzer ,still, it was similar in appearance to the previous, projectile, except that it appealance to the previous, protectite, except that is did-not have the activeded hase plate, (pp. 409-60) di 150 cm HE Protectile 19 (15 cm gr 19) for Heavy Feeld Howstrees (sFI) 15 and sFH 18) or for Heavy Turner Howstrees (sHT), it was about 25° long and contained 3-46 ib of TNT its cardboard containers) as a bursting charge. A small charge of smoke com-position was placed on the bottom of the shell. The projectile had a sciewed-in base plate. Two types of projective on the point of detonating fuzes were used; impact and com-bination (AZ 23 and hopp2 s(00) and two types of boosters (Gr2.dlg C/98)p and Gr2dfg C/98) (pp 500-301) is 353 mm Anticoncrete Projectile (35.3 cm GrBe) for Howitzer Mi was conventional in design and contained 75 lb of TNT as a bursting charge and a smell charge of a gmost composition used for spotting purposes. Total weight of loaded projectile was 1265

Its.

Note: According to information supplied by #LH.Bullock and A.B.Schilling of Picatinny Arsenal, it might be assumed that the HE filling consisted of four sections loaded in a cartion, the Lit and 2nd front sections were cast INT. containing 5-10", wax, the 3rd section was cast atraight TNT and the 4th section was pressed TNT (or possibly

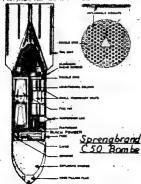

pictic acid). It is presumed that the 4th section acted pione actor, it is presument to does not seem possible as an auxiliary booster, because it does not seem possible that the large mass of cast TNT could have been exploded

that the large mass of cast INI could have been exploded by the small booster (shown on the drawing) which did not extend sufficiently into the busining charge. () 100 ms Mortar Projectile (10 cm Wgr 37) used in 10 cm NbW 35. it contained 3.125 lb of INI as the 10 cm NbW 35. It contained 3.125 ib of TNT as the bursting charge and a small charge of mode componation located underseath the booster (GeZdig C/98Np) and the fuzz (Wg/Z 3b). Total weight of the projectale was 16.0 by 534h.

to true traps of the control of the The applosion of the black powder charge also seemed the alaminum acrows securing the base plate and elected size according elements over a radius of about 100 yards. About I second after expulsion, the delay element is the booster reached the decommon and fired the [NT charge in the cost of the pompe

Total weight of bomb was about 75 lb, overall issuath 42.5°, body length 28.0°, body disnester 8.0°, wall thickness 0.15°, mil jength 16.0° and its width 2.3°.

Sprongelaprengatoffo See Sprengel Explosives in general section.

Sprengeolatine (Blasting Gulatin). According to Stattbacker (Ref 1) the German Sprenggeintme contained: NG 91-93 and collection cotton (N custems 11.8 to 12.4%) 7 m 9%.

According to Beachels (Bet 2) the 93/7 Speningelature had the following properties: temp of explosion 47! . C. vol of gases at NTP 712 l/kg, density of lessing 1.55, specific pressure (f) 1200 kg/cm², velocity of detoanton 7800 m/sec. Trausi was 520 cc and impact sensitivity with 2 kg. weight \$2 cm.

\*\*Stendord\*\* Propellent, (Einhe inspulver or EP), called

\*\*Unis\*\* Powder by H.H.M.Pike (ClOS Rept 11.68 (1945),
p 6.], was a "S" Putwer (dictartement) difference propellant) which contained 1.4% K attack or 4% hydrocellulose pelland) which contained 1.4% K attage of 37 hydrocaltions and had a caintife value of 710-720 keat/kg. This mixture was introduced in 1944 as the "Service" propellant for all ammunities in order to minimize the differences in ballistics previously usually obtained when propellants. with the same formula were manufactured at different plauts. The incorporation of either K nitrate or of hydroplant ballistics of propellants.

Stenzprobe(Punch Test). See Analyt Section, Brisance Test s.

Ster Shell. One of the projectiles (10.5 cm Louchtgeschoss FES) described in TM 9-1935-3 (1953), p 464, contained a star unit attached to a parachute. Then the shell reached a predetermined position over enemy territory, the time

and Yugoslav .

A later projectile (20) mm) serving the same purpose ... intget puricellis (A) may serving me make purpose but designated the fixer Projectile, is described on pp 519-20 of TM 9-1985-1, its German designation was 20.3 cm Lauchigueness and it was fixed from the Railroad Gon, K(E), (See also under Flare).

Steachpeabe ader Brizanzprobe; (Compression Test., or Brisance Test, Incres also se Crusher Test). Iwo tests of thin kind originated in America and Germany. The first method used the Doringher Betriebe - Stauchungmesser, an apparatus invested in 1879 by Hean, while the second method used the Brisensmeaser nech Kunt, so apparatus invested in 1913 by Knat.

Sock of these methods are described by Stretchicker (Refs 1 and 2) and in the general section under Brisance Decerminations.

Sensit (Scouize): One of the Carbonit-type , explosives manufel about 50 years ago in Germany and admitted to. England. It consisted of NG 68, kieselpahr 20, wood men 4, and K or Be neceste with Mg carbonate 8%. To this could be added some sulfounced oil, or last [ Deniel, Dictionnaire, Paris (1902), p 739 1.

Shorm Matches According to BROS Final Rept 1313 (1947), these matches were manufactured by the Deutschen Zimé-waren Monopole at Limeburg. No descriptions of match

Struckungsmitted ader Struckmittel (Examples, called also Stretcher, Filles or Diluting Agent). In order to combat the shortage of gromatic astrocompound explosives (such se INT), the Germann incorporated some non-explosive secretain which served to increase the bulk of the exploures. The most common of such extraders were

aridizing agents, such as Am, K, or Na nitrates. These anhumaces were not inert as they supplied oxygen to owers defficient promotic nitrocompounds, such he TNT. Other German extenders, auch as Na chloride, being neither oxidizem not combustibles were not as useful, although is wan claimed that mixtures of TNT/NaCl = 50/50 or 40/60 developed considerable and pressure on explosion.

Explosive compositions in which extenders were used were called Emattapresentoife (a v ).

Secularized C 500 (Container for Scattering Inconding Bombal, is consisted of a metallic tube, divided along its Bomba). It consisted of a metallist tube, divided along 10 longitudinal sais into two sections welded together, with a princeed maintain as a metallist of the property of the and the primacord. The detonating wave travelled sling-side the seam and caused the separation of the two halves of the complier thus scattering the incending boxes over a target. Thin device did not work very satisfactorily. Reference: TM 9-1985-2 (1953), p 117.

Structurel Explosives (Blast Effect? Explosives), At the time of the development of cockets in Germany (during WV II) the military authorities requested the Krimmel Fabrik, DA-G. to produce high explosive charges which could be used as missiles without being confined in strel canings and thus to save dead weight. It was suggested by the Kristmed Fabrik that material consisting of layers of paper 20 parts. impregnated with 80 pm of moltrn TNT, previously mixed with RDX and NC, be used for the construction of such projectiles. The other suggestion was to combine synthetic projections, and other neglection was so combine symbols one sense (thermolination and thermoenting) with RDX and is one this mixture as the HE for such projectiles (Ref.1). It is so be after that such projectiles produced high

blant offerts (Luftdruckwirkung oder Luftstons), but community ly low shattering effect, called also beisance (Brisner). Proctically the same kind of blast effect was achieved with a HE in bombe constructed by filling a thin, light, metallic case, strong enough to withstand handling and shipping but too; weak to withstand impact with target. These bombs (called in the USA the lish: case bombs) were of very high capacity (about 80%) and caused considerable damage by blast effect alone, especially is maidential acctions. They were fuzed for superquick or amakeles action.

The larger size bombs were called, blockboarers is Great Britain and the U.S.A.

Sulfurie Acid (Schweitinaure), Preparation, properties and uses are given in the general section. The connect method, using a vanadum carelyst, was the most common to Germany, but some plants used the old chamber process and at least one plant used the wet contact process utilizing bydrogen sulfide. The Chemische Düngenabnik A.-G. user the so-called Peterson Tower Process installed by the was the primary material, incomuch se mility was not pientiful during WW II, a special process (Splitting or Cracking Process) which permitted the recovery of sulfur in the form of sulfur trioxide from waate weak sulfuric acids was developed and constructed by Lurgi Co (See under Lurgi Cracking Plant). This new process of manufacture of roleum was used by several Gennan factories but it is doubtful (see Ref. 13) if the process would be economical. in peace time when sulfur is pleatiful. Another sulfur is saving process is briefly described under Sulfur Recovery. The number of German sulfuric acud plants was very great but the following plants, briefly described in various

Sulfur Manachieride - Vagetable Oil Dynamites were prepared beginning about 1898, by the Chemiche Fabrik at Winkel on Rhine by mixing NG with tubber-like products obtained on treating vegetable oils (such as lineed oil) with sulfur monochlorade, S.Cl., Other ingredients, such as TNT, P.A., etc. could be incorporated.

Similar explosives were prepared by Birlefeldt. Reference: J. Daniel, Dictionacire, Paris (1902), pp 71 & 134,

Sulfur Recovery from Smoot Iron Oxides. To reduce the shortage of sulfur (so essential for the manufacture of sulfurit acid) the Chemische Fabrik Dr. Jakob, Bed. Kreunisch before WW II; invented a method of recovery of sulfur from the upent oxides which were used for the pudfic season of gases in the Sincher-Tropich Process Plants or it the Gas Works. One such installation was at the Chemische Fabrik, besseling. It was reported that not less than 65 000 tone of saller were recovered annually by this method

Lurgi Cracking Dr jatob's Process was essentially as follows:

a) Four vertical cylindrical racketted extractors, fitted with covers and each containing air mays were loaded with covers and cach containing air mays were looked with spent oxides (7). Does in each years) and extracted with carbon disulfide, at 25 metering each vessel at the 'by' and nowing by spaniny b) Of the 4 extractions, 3 were in the extraction cycle and one off for charging of sinchigring. As a freshly charged extractor was put on the line an extractor containing exhausted oxide, was taken off

Topored Born Gun (Wargebohrung Geschätz), called alm Gerlich Type Gum, Squage-Bare or Reducing Bare Gua was developed in Germany in the early stages of WW flu-its barrel commissed of 3 sections (starting from the breech): a) Cylindrical section, such as 42 mm bore dismeter

b) Slightly conical middle section and

c) Cylindrical section, such as 28 mm bore disneter.

There were also gians with diameters 28 mm or 75 mm for (a) section and 20 mm or 55 mm for (c) section.

Because of this construction, the projectile which

had a spool-like body, was aqueezed to a smaller diameter as it passed from the breech to the maxule. The idea of this gun was to present a large-cross-sectional area of the projectile to the propellent gazes, and to present a small cross-sectional area to the atmosphere in order to reduce air resistance and thus increase, the muzzle velocity of the projectile. It was claimed that the most valuable advantage of this type of gun was the possibility of reducing the total length of a hore almost to one-half without any changes in maximum pressure and muzzle velocity and preserving almost the same weight, of projectile.

Although this weapon was light and gave comparatively good amor-penetration it was given up for the following \*\*\*\*\*\*\*\*

a) its manufacture was very difficult

b) It wore out too maidly

c) Its effective range was rather short,

Some of the inpered-hore gues and their projectiles are on display at "the Aberdeen Proving Ground Museum.

A chorr description of such runs is siven by: L.E.Simon, German Research in World Was LL. I. Vuley, N Y (1947), p 189.

"Note: According to b.Englenburg, The Ordonness Sergerist, May 1944, p 312, the invector of this gain and its projectile was an American born German segment, H.Gerlich, lesseding in Kiel, He worked on the development of high velocity weapons and projectiles from about 1920, and in 1932 weapons and projective from about 1920, and in 1932 the demonstrated at Aberdeen Frowing Groved, Me stille firing a missile with a velocity of about 4443-16/acc. the Greenan. The first hown combat use of the Gerich Finciple was made in the 3-yaian campaign. The weapon employed in Lybia smar-the 7.28/2.0 Pak, a light national empiryed in Lybia onas-the 2.247.0 Pak, a light anxissalt gas monated on reco-wheeld cavinger, in the gan the gan and the part of the part and a hearty spoom shell of about 20 mm canter emerged from the muzzle of the gam. Tallerupparete ader Heizhere Machenszhine (Plate Annamens or Heauphle Hining Machine). An apparatus suitable for mixing would and liquid ingredience of explosives, propellants and pyrotechnik compositions. It consisted of a large horizontal, cast 1000, steam-meketed, cylindrical pan on which the materials were placed. These were created and mixed by the combined action of a long, small diameter, horizontal roller (made from a non-specking metal, such as Cu, brass, of Al) rotating around the creater of the base at the rate of ca 3 spm and a series of scrapera (made from non-sparking metal) following behind the toller. The scraped material was reground by the roller and then easin pracraped and this action continued justil all the ingredients were well mixed.

The apparatus was manufid before WW II by the Gobe Burberg, Mertmann, and could be operated either in the cold, or beazed by steam. Reference: Stettbacher, Schiese- und Sprengutoffe, Lainzia.

Tellerate (Dish-like Land Man). Accheding to Simon (Bel 1) these mines gave the Allies considerable trouble throughout WW II. They were sufficiently powerful to put a tank out of action and to wreck almost any other vehicle. The first of such A/T mines, called Tellermine 25, was made of steel, while the models developed towards the end of WW II were made of how-magnetic materials to render mine detectors inclientive. Some of the latest mines were reported to be remote-controlled but it is not known whether they west actually used in combat.

The following models are described in Ref 2: Teller mine 35 A/T (p 267); Tellermine 35 (Strel) A/T. (p 268). Tellermine 42 A/T (p 269) and Tellermine 43, Pilz, A/T (v 2701 (Pils mess mushroom),

Essentially the body of the mine was a circular, flat, disbelike form with a hole in the center of the cures. The body was loaded with 11-12 ib of compressed high explosive (such as INT) and so isniter was acrewed into the cover, A second (floating) cover was held down by a metal ring attached to the body and was supported in the center by a heavy spring. A pressure of 200-400 lbs on the "floating" cover was sufficient to depress it as well as the igniter bosning. The pressure of the bouning on the top of the atriket sheared the pin which held the striker in the cocked position, thus releasing the striker spring. As a result of this the striker set off the percussion can. detonator, booster and the unit charge such as of TNT. References:

Testing Gallery (Schlagwetterverenchmrecke). See general section, under Galleries, Tenting and also this section

Totan oder X-Staff (Tetranstromethane, abbreviated in this work as TeNM or TeNMe). A demiled description rais work as leave or ferowel, a ownittee one exception of the preparation, properties and anes of I-relike is green in the general section under Methane. The following description concerns the German method of preparation and ages of I-relike. a or I enMe.
As the classical sectod of prepa of TeNMs from scatic

sabydride and nuric soid (see general section) to very expansive, as new, method was developed during WW-M by Dr Schimmedatchinded (Refs. ], & 2). The ishorancy scale procedure was an follows:

procedure was an follows: in an all-glass appearant, achemantically represented on the enclosed drawing, acetylese macrod such attric-acid to give involves and the manusc of aircolous and aircic acid yielded TetMe on bacong with suffurir acid, The sysction was believed to proceed as follows:

CHICH+2hNO. (O\_N)\_C.COOH

=(O\_N)\_CH\_CHO+H\_O (O\_N),CH.CHO+HNO, (O\_N),C.CHO+H\_O (0\_N)\_C.CHO+2HNO \_ (0\_N)\_C.COOH+2NO +H\_0 =(0\_N),CH+CO.

(O,N),CH+HNQ.

= (O\_N)\_C+H\_O

CH: CH+6HNO. =(0\_N)\_C+4H\_0+2NO/\_+CD\_

About 60% of acceptance reacted as above and about 40% underwest complete oxidation according to the equations CHiCH+10HNO\_=2CO\_+10NO\_+6H\_O\_ so that the overall equation could be represented by:  $5C_uH_u + 38HNO_u = 3(O_uN)_dC + 24H_uO + 7CO_u + 26NO_u$ .

The recovery of nitrogen dioxide and of unconverted entric acid was about 96% of theory.

in this procedure the acceptene gas, C. H., was introduced at the lowest point of the system at the rate of 93.5 liters per hour and the nitric strid (98%) containing mercuric nitrate as a catalyst, was fed at the rate of 2.4 liters per

hour. The entalyst was prepared by dissolving 70 g of mercury in about 500 ml of 85° nitric acid, adding 300 bil of water and making up to I liter with 89% nitric acid, and the state of t I wenty ad of this solo was added to every 10 liters of 98% natric acid fed.

By circulating cold water through the cooling coul located in the 2nd leg of the seaction system, a temperature of 30° was maintained. The solution of nitroform in nitric acid overflowed from the circulating system to three nitration vessels (3) placed in series, each accrete being heared by a necess jacket. The sulfacie acid from the TeNNe purific ing there (5) together with the nitroform mixture flowed into the let attrame and the 'estrantrocethaps' and retining acid overflowed from the led nitrator. The tene in each nitrator was maintained at 90 perature in each nitration was maintained at 90° and the

contact time of attration was about 5-hours. Each nitrany was provided with a reflux condenser for returning TeNMe and HNO as well as my condensable gazes such as NO. The wasse memory leaving the 3rd airmory quitkif separated, in (4) and the top layer of TeNMe was ted continuously to the purification tower (5). The feed of continuously to me purification tower (3)), line feed or 95.5% sufficiencied to the purification tower (5) was 1,71 per bour sed the tun-olf product was charged to the furniture (3). Park TeNhe left the top of the purification tower (5) as the man of 440-460 g per bour and was collected in

a tank (GL

The off-gaues of the situation system Pauch as N.O. CO., with smell amounts of HNO. (NO.) a. CH(NO.) A. and possibly coreacted C.H. ) passed to the parification column (7) which was divided into 2 sections. In the lower section the last maces of C.H. were removed by acrubbing with warm nitric acid (containing mercure nitrate) in with warm mittic acid (continuing mercura nature) led as the rate of 1.4 fper hour, in the upper accision of equipment of the continuence of the c uses (7), whereas the CO, was allowed to escape. Total Sprengstoffe (Termaitromethane Explosives), it was mentioned under Erantsopresigntoffe that, due to the acute : shortage of TNT and of other high explosives, the Germana used during WV II, an ingredients of explosive mixtures.

substances which were not explosives. Among such subatances was TeNMe (terreattromethane), called in Germany Tetan, a liquid waste product of the manufacture of TNT

The first Tetan mixture consisted of very finely pulverzed sluminum (called Pytoschisff), impregnated with TeNMe, and a small amount of the following substances. a hydrocachon rach to hydrogen and a consolidating compound called "K,", which was a nigh dispersion of silies prepared by a special process. The hydrocation was added in order to increase the sensitivity to initiation. This Tetan explosive was a sould possessing a very high blast effect and a comparatively low velocity of detonacion. Explosives with such properties were found to be suitable for inderwater explosions (Ref 1)

Other explosive mixtures consisted of Tetan with liquid or pulverized carbon containing substances, such sydrocarbons, coal, charconi, nitrocompounds, etc. Same of these mixtures were more powerful and brisant than TNT. P.A. PETN or RDX, and were particularly suitable for underwater explosions.

Considerable work on this subject was done by Dr

A.Stertbacher (See general section under Methane). One of the most powbrint and brisant explosives, known is a mixture of Jetsa with toluenc, its yelocity of detonation s about 9300 m/sec. There were also explosives prepared from derivatives. of TeNMs, up for instance the perchiotic exter of trinitroethanol. The trinstreethanol (mp 700) was prepd by con-

densing nitroform (derived from TeNMe) with 40% splution of formaldehyde. Referencen: 1) G. Rómer, PBL Report 85,160 (1945), pp 2-3

2) A.Szentbacher, Schiese und Sprengeraffe, Leipzi (1933), p 185 and Ibid, Spreng and Schieseroffe, Züric (1938), pp 10, 16 & 148.

Tetrocene (Tetrazen) was peepe in Germany utilining the

same conjument as used for prepa of L A and L Ste The procedure was as follows:

a) To a solution containing 4.0 kg of Na nitrite and 1.5 liters of normal acetic acid in 60 liters of waterprehented to 50°, was added gradually and with airagitation 40 liters of an aqueous solution of 5.3 kg of aminoguanidine sulface. The addition took one hour b) After stirring the mixture for an additional hourest and for 1 hour at 20°, the reactor was tipped and the contents caught on a filter cloth made of horse

c) After washing the ppt with several portions of water, it was dried in the same manner as described under lead axide. This gave about 3.0 kg of dry tetracene d) -Boiling the mother liquor for several hours was sufficient to destroy any waste retracene remaining in

A similar method, used at the Fabrik Volfratshausen Chemische Erzeugnisse and at the Stadeln Fabrik, Dynamic A.-G., is described by Sheldon (Ref 3), in this description the following decayls of the method which are worthy of montion are given:
A. A solution of aminogunaidine sulface (5 kg per 40 l

of water) was neutralized (to the litmus paper end point)
with either acetic or nitric acid and then added to a perbeated solution of Na natrice (2.5 kg per 50 l of water). If the addition rate was rapid, small, slow settling caystals Tetracene were produced and if the addition, rate was slow (2 hours), larger and faster settling crystals resulted. B. The detailed procedure was as follows: A temperature of 50 to 35" was maintained throughout the entire reaction period which was allowed to proceed 30 magutes after the last of the aminoguanidine sulfate solution had been added to the reactor. Then the agitator was stopped the product allowed to settle and the mother ligaor removed

by decanation.

After the decantation of the mother liquor, one dilution Comes given and then the precipitate was flushed from the tilted reactive onto a large cloth supported on a natural distinger filter (as for lead anies). After three additional desirance filter (as for lead anies). displacement washes, the cloth was folded over the tecra-ciple and the ensemble placed in a plastic bucket to be

chee and the ensemble placed in a passart control with transferred to the storage area of the dared prior to use, the place of the place of the storage area of the storage and menaferred to the storage ares.

E. The yield of Tetracros when using 4.0 kg of smano-gramations sulface was 2.6 to 2.7 kg.

The following prising mixtures containing Tetracene are listed in Ref 31. Priming Mixture No 30/40, used for riffs and pistol cartridgest Tetracene 3, Pb styphnam 40, Pb allower 42. Ca silicide 10 and Pb dioxide 38.

Terracene was used in initiating mixtures called \$6m. (See also Tetracese in the general section).

Tetro-Di-Soin (Teurs-Di-Soit), described in the general nection as Tetramethylammonium Distram, was prepared in Germany by dissolving the Tetra-Salz (see below) in bot 60% nimic acid and allowing the solution to coul. The crystale obtained by filtering were dried in a vacuum. The sait was stable at tomperatures up to 100°. Its mixtures with amountum nitrate and a small amount of RDX were found to be suitable for filling projectiles. (See also general section).

general section under Carbazole.

TeNCbx was proposed during WW II in Germany as a substitute for Mack-powder in illuminating flands of the sucket type (Ref 1). Due to the fact that TeNCbx was combigated to completely a substitute of completely type (Ref 1). Due to the fact that I era-Con what observe gre-scopic and non-corrowave it was expected to completely replace the black powder in igniser compositions (Ref 2). According to Ref 2, the Germans, prior to 1943, used black powder as the main ingredient of their pyromechase names powers as me main ingresient of their pyronechaise "intermediate" ignater compositions and it was observed that their storage in contact with magnesium contaming flare or star compositions (such as Mg 20, Bo nigrate 37 and chlorinamed-polymay) chloride 23% remitted in dereportation of the pyrotechnic devices. This was caused by the interaction between the sulfur (of black powder), ningnessum (of the flure or stat) and mouseure (of atmosphere), grving hydrogen sulfide and magnesism outle, On furthe groupe, the hydrogen sulfide; attacked the lead salts fauch is Ph. azide or Ph. styphnate) of the namer than rendering them unserviceable.

To kvoid the destriction in stomes of pyrotochese devices containing magnessum, it was proposed, is 1945, to replace the black powder type "intermediate" composition by the (ollowing mixture: TeNCba. 30, K altoses 40 and A1 powder 1975.

Terra Sals (Terra-Salt) is described in the general section under Tetramethylammonium Niconte. This subscance is not an explosive by itself, but it forms powerful explosive compositions when mixed with exidizing names such as nitrates. It was prepd in Germany in the pure state by the interaction of merbyl nitrace with trimethylamine. The mixtures, of Terra-Salt with nitrates were found to be suitable for filling projectiles and for making propellance for cannon, an well as for tockets. References:

1) PB Rept 85,160 (1946) 2) PB Rept 28,271 (1947).

Torre-Sala-Perchloser (Terre-Sale-Perchlosere) . This courpound practically insoluble in water, was obtained by treating TETRA-Salu with perchloric acid. When innited the substance burned with a small bluish-white, sporkling flame. This behavior suggests that it might be useful in pyrostchnic compositions. Reference: PB Rept 78.271 (1947), p 21.7

Terryl (2,4,6-Trinisrophenylmethylnitramine) is described in the general section. Used by the Gemano during WW II as a sub-booster in some protectiles and as a burnting charge in some land mines.

Following is a prief description of the semi-continuous method of manufacture as used at the Troindorf Fabrik. DA-G. The installation consisted of two stainless steel nitrators, peveral stabilizata and one crystallizer.

a) After adding 60 liters of mixed nitric sulfuric acid to the first vessel and smering the agiration, the airration was conducted by continuously adding equal volumes of a sulfusic acid solution of dinitromethylaniline and mixed acid, as above. The temperature was deintained at 40°C

b) The shurry of meryl and acid was ned continuously into the Ind vessel where the temperature was maintained at 25

c) The contracts of the 2nd wenter were two continuously through a standers steel bleeve where crude tetral separated from the spent acid

d) By means of a large amount of water, the crude terryl was tonastened to a series of stabilizers where it was washed, first with water, then with a delute and

sab solution and sense with water e) The moist tetryl was secrystallized from acetone by a special process (very vaguely described) and then doed and acrossed

According to BIOS Final Rept 644 (1945) Tetryl was also used in Euchbach Gasleys Electric Delay Deconston massid at the Trousdoct Fabrik, D. A.-G. References:

"Ther" and "Kerl," Morters were actually heavy, shore berrel howitzers, designed by Krupp Co for the destruction of very arong fortifications. In some ways these weapons resembled the Big Bertin (420 nm = 16.5") gus used during WW L. The Thor and Karl weapons were (umished in two calibers, 540 mm and 610 mm. The 610 mm barrel was 8 calibers long and fired a 4400 lb shell so a distance of seady 4 miles, in order to increase the tapge, the craddle was modified to take a smaller tube. This gave a >40 ram weapon which fired a 3310 lb shall to a distance of about 7½ miles. To increase the mobility of each weapon, it was monated on a modified Pzkpiw IV channis (See also under Panzer).

Tieflander Verfehren (Deep Bonding Process). This term designated a method of deep nurface treatment of nintered metal projectiles developed by Dr V.Duffek and collabocators. The method was claimed to diminish the' went of sun harrels and to increase the effectiveness of armor penetration of these projectiles.

Previous to WW II, the Germans, in some of their apid-fizing guan, used projectiles containing either a lead core or a lead head with a sheath made of cast iron placed with tombuk towal (as alloy of Cu and Za), Beginning about January 1941, when a shortage of lead developed, the German tried to use projectiles made entirely of sistered iron, flowever, the use of these projectiles was not a success because the wear of the born, was so must

that after about 400 rounds the gun became unusable. in order to decrease the friction, an attempt was made to zincare the sintered mod projectiles, but this method did not decrease friction sufficiently to effect a noticeable decrease in the wear of the bore.

Knowing that some crystalline morganic compounds bossess the property of showing decreased friction when subjected to high temperatures, high pressures, or to a certain extent to impact streams, Or Duffek proposed to cover the sintered metal projectiles with such substances. The surface covering was schieved by the phosphacizing process (used in industry to reduce corrospon), which consisted essentially of a treatment of an iton object with an acidic phosphate solution (Parkerizing). As result of this, a thin layer of crystalline iron phosphate was deposited on the surface of the metal.

Although this method of phosphatizing decreased the friction of projectiles in the bore, the amount of phosphate deposited on the surface was so slight as to be removed by cassage of the projectile through the bore. This meant that if the method were to be used for armor-piercing projectiles there would not be enough low-frietton surface material left to improve the penetrations of amor.

The inventigation of Dr Duffek was continued, and on the screage of his suggestions a process was developed by the Metaligenelisthat A -G , Frankfurt a/M (Dr L. Schuster) (Ref 2) which permitted deposition of thinker surface layers of phosphate cryatals due to deeper penetration of the phosphare solutions into sintered iron objects.

This process, called Tiefbonder-Verfahren (Deep Bonding Process), may be conducted by one of three methods described in the patent. The following method was recommended by Dr Duffek:

a) Treat the sintered iron article with vapors of prichloroethylene in order to remove any oil or fat from the pores

b) Transfer the article to a bath containing 8 g of NaOH and 2 g NaNO per liter and maintained at 95° c) After remaining there for exactly one minute, remove the article and, without rinsing, place it in a bath consisting of solutions of Zn phosphare and nitrate (containing 5.4 g Zn, 7 g P O and 6.9 g NO per liter). The bath is maintained at 895

d) After keeping in the bath for 5 minutes, remove the article and rinse it thoroughly under cold water e) -Treat the article for one minute at 95 in a bath containing 5 g of a mixture consisting of 30% Na silicate, 45% NaNO, and 25% NaOH per liter. Thea place it for 40-60 seconds in a bath containing a solution of 0.5 g Na chromers per liver of water and paintained at 95

f) Remove the stitcle and dry it.

It was claimed by Dr Duffek that when almered Iron bullets treated by this method were fired from a piscol (in 1942) there was no noticeable wear of the bore even after 4600 counds. This was considerably better than with the pre-WW II bullets with a lead core.

On the strength of this success, Dr Duffek was allowed by the German war Ministry (near the end of WW II) to develop a new type of AP (armorphereing) projectile, After prolonged investigations, the following method was de-

veloped;
A sintered iron sheath, consisting of line grains of iron on the inside layers and coarse grains on the outside sheath. Fas welded to the surface of an ordinary solid steel projectile. The welding was done by the high-frequency method (Hochfrequenz) developed by the Siemens Co.. Then the surface of the shell was treated by the Deep Bonding Process, an described above.

About 30 projectible caliber 20 mm, and some 37 mm, were prepared by this method and then instead by firing against a 5 cm chick chromiour-nickel states farmor plane placed at a distance of 200 meters. The smalls showed that the average penetrative was about 2/3rd deeper than with an autrovated standard 40 sheet.

Triemylenesly coldinitres o 2 Sec Triglykoldinitres ...

Trigiykoldinitres (Triethylegeslycoldinitraty) (TEGDN), See also in the general section, it was proposed by General Gellwitz for use so a geletminer in cool double-base propellant (G-pulver) destined tos tropical climates, such as Africa, Although TEGDN is much lose volatile than DEGDN is in more volatile than NG (about 1.5 times). It bee good chemical stability and is a good printinizer. im calorific value Q- in 750 kicel/kg, with H O liquid. It in obtained by the nimicion of triethyleneglycol (TEG). a by-product of the manufacture of disthylengelycol (DEG). The highest yield of TEG is below 20%, the most bring DEG. For safety reasons the spent acid must be drowned. which makes the process rather unecommical.

Following in a brief description of the attention as practiced at the Krimmel Pabrik, D A of a

500 he of such TEG (which usually contained none DEG) was run slowly late mixed acid consisting of 70% nitric and 30% sulfurie acids, stiered and maintained az 25 C. After 30 minutes of nitration the mixture was drowned (see Note) in a large volume of cold water. The senumed oil (TEGDN) was washed twice with cold water, core with dilute sode ash solution, sed finally again with water. The yield was 650 kg, or 130% of TEG.

Note: As the mixture obtained on nitration of TEG is extremely unstable it was not allowed to stand to effect the separation of oil (TEGDN) from the spent acid, as in the general peactice with other nimsted glycols, glycerin, etc. Another reason why the mixture was drowned in explained by the high solubility of TEGDN (8 9%) in undiluxed spent acid and comparatively low solubility in to told diluted by water.

Following were the properties of mechanical TECHNI-N =12.1 to 12.2%, vs theoretical 11.67% (see Note below). color-isowaish, de 1.335, theretal ambility-satisfactory (the 82 Kl braz gave 20 minutes), impact sensitivity-could not be exploded by the impact of 2 kg weight.

Note: The high N contract of such TEGON may be due to the presence of ne much as 21% of DEGDN.

Tellans are extremely toxic products discovered before WV II in Switzerland and in Germany during research atedies on insecticides derived from phosphoric axid. Dr Wisth of Berlin studied the toxic properties of these compounds with a view to their military application and recommended some of them to the German Government.

About two hundred toxic denvatives were prepared in Inhornecies of I G Farbenindustrie or Ludwigshafen but only the following three were considered mitable for military applications.

a) Tehen (Trilon 83 or T 83, plso called T 100) was the

mone other actor of dimethylaninecyanophospharic acid,

(CH.) N.P.OC.H It was propd by treating the

dichloride of dimerbylaminophosphoric acid (an irritating agest called Product 39) with Na cyapide, ethanol and chlorobeazene. Technical Tabus was a dark benwa oil with a fighy odor and d 1.077 at 20°, to the pure nmor it was colorless.

Tabus was planned to be used in chemical bombs and rockets, Initially the Tabun used in munitions .. contained 5% chlorobenzene (Tabus A) but, to render this product more stable and to lower its vapor tension, he amount of chlorobenzene was increased to 20% (Yabus S).

North: This compound is called by H.A.Curtis, CIOS Report 28-62 (1945), p 24, Terbub or Trilon 83.

b) Seem (Trilos 46 or T 46, also called T 114) was the menoleapropyl ester of methylfluorephosphoriz acid. o CH

CH P.O-CH . It was prepared either F CH. by the "salt process or by the reassagement process mentioned fait one described by Collogo, Saria was a colorless, odorless

and very volatile liquid about 3 times as toxic as Tabun. Due to the fact that Sarin was more toxic and more resistant to heat than Tabun, it was played to

use it in municious in preference to Tabus. According to McLood (Ref 2) , Sarin was invenued by G.Schrüder, and is called the "perve and". c) Somen (Trilon?) was the monopinucolis 'ester of

methylfluorenhosphorie anid, CH . P-O CH . Is was CICH,)

puepel according to Collomp in a manner similar to

Some's was a colorless liquid having an odor of camphor, it was less volazile than Sarin but even more toric.

Production of Trilons scarted about 1940 in a specially constructed factory at Dybernfurth-an-der Oder, 40 km from Breslau. The factory was never discovered by the Allies and is sow in the hands of the Russians

Trimethylaminoexide Nitrote, (CH\_)\_IN:(OH)(O.NO\_). This compound was prepd by Walter et al by treating trimethylsminooxide, (CH ) NO, which is a base with nitric acid. The trimethylaminouxide was prepd by the oxidation of erimethylamine, (CH ) N.

Tramethylaminooxide aitrate proved to be of low thermal stability and was considered unsuitable for use in military explosives. Reference:

H. Walter et al. German Developments in High Explosives. PB Rept 78,271 (1947), p. R.

Trimethylammenium Nitrate, called by the Germans Tri-Sals is described in the general section.

Trinol-One of the names for Trinitronaphthalene.

 $2,4,6\text{-Trinitromine-1},3,5,7\text{-tetromethylene-1},7\text{-dinitrate,}\\ (0\_NO)CH_{g}\text{-MINO}_{g})CH_{g}\text{-N(NO}_{g})CH_{g}\text{-N(NO}_{g}), m.p.$ 155°; was obtained during WWH as a by-product of the manufacture of RDX, using either the E-Salz or the K-Sala process. These processes are described in this

section under Hexogen The power of minimuminous maniethylene dinkente as determined by the Trauxi Test was claimed to be higher than for RDX.

Reference: G. Romer PBL Rept 83,160 (1946), p 16.

Trinitroonisei eder Trisel (Trinitrosaisole) (TNAss). See general section under Anisole. TNAns was used in Germany during W.I as a filler for long range proiectiles (Ferneeschütseranssen) fired against Paris and also in some bombe. . . (See also Dinitroanisol).

Reference: A. Stettbacher, Spreng- und Schleinstoffe, Zürich

Trinitrobenzel (Trinitrobenzene) (TNB). See general section under Benzene. TNB was used in Germany as a military explosive under the name of Filler 70. Reference: Allied and Enemy Explosives, Aberdeen Proving Ground (1946), g 112.

Trinitrochlorbenzel (Trinitrochlorobenzene) (TNCB). Ser general section under Chlorobennens. The compressed TNCB was used by the Germans during WW II under the name of Filler 60 and was cast under the name of Filler 61. TNCB was also used in adminture with Am nitrate under the name of Filter 64.

Reference: Allied and Enemy Explosives, Aberdeen Proving Ground ( 1946), p 113,

Trinitrodichlorobenzal (Trinitrodichlorobenzene) - [TNDCBL See general section under Dichlorobeazene. TNDCB was used in Germany as an explosive and also as an inseccicide.

Reference: PB Rept 1820 (1945), p 10.

Trinitre - N - emylaniline is described in the general section under Ethylandine. It was investigated during WW II as a possible substitute for black powder and smokeless propellants especially for use in moreats and Faustpassone. The development was stopped due to the unfavorable raw material situation (See also under Treibustze). Reference: CIOS Rept 25-18 (1945), p 28,

Trinirementation (Trinirromphthalene) (TNN), and Olatistinaphitalin (Dinirromphthalene) (DNN) were used by the German during W.II is some composite explosives. They were summartured at Semitin Fabrik, Pardahires. Carche-Stowakia. See also general section under Naphitalene.

Trinitrarassecia (Trinitroranorcinol) (TNR), or Styphaic Acid. See Trinin .

TRINITROTOLUOL oder TROTYL (Trinitronolucae) (TRIT) Pelipulars O2 oder Fp O2 (Filler 1902). CH -- C. H. (NO.). 12 in described users fally in the general

nection under Tolumen.

TNT was officially adopted in Germany in 1902 me a military supplicate, earlier than in any other country, its archal use by the Anny was began in 1904, and the jodustrial production started in 1906 at the Schlebusch Pabrik, D A «G.

For the description of German methods of purparation of TNT, an practiced before, during and after WE, I, and the tooks of Escales (Ref. 1) and Senthancher (Ref. 1). The same books give also the properties of TNT.

It is to be soord that before and during WW I the Germann used a rather complicated process for the samufactures of TMT. This was due to the fact that tolksens in those days was rather impres. This method, described by Ess.eloc (Egd I, p. 197) was briefly as follows:

After altracing tolurue by means of weak mixed aisticsulfuric soid to produce MNT (mononitrotolurae), the crede product (mono-oil) was separated from the monospens acid, then washed with water and finally with weak node-ash solution. After blowing live steem through the oil (in order to remove the besizene persons as an imputity as well as any unaissaced solution; i was cooled to allow the publit to crystallish (a a 51.9°C). After separating the p-MNT by filtracipa, the remaining liquid fraction, was subjected to Imerican distillution under vacuum uning a column apparetus. The o-MNT came off first, bearing the se-MNT as' a resides. Only po and middle were used for the perpa of military grade TNT. The m-MNT was used for the peops of liquid DNT-TNT mixture (Drip oil) ineful as an ingredient of commercial explosives. Another method was to distil the o-safeT from the washed mono-nil and then to "bul the residue in order to separate the Point T from model T.

The method of purification of TNT proposed by the Chemische Fubrik Grünnz was described in Gar P 207-170 (1904).

During WW II the German dapacity was as such as 55 million pounds of TNT per month, but the maximum they were produced was 49.5 million in April 1944. The TNT used by the German Army bad a mp of 80.4-80.5.

The measuacture of TNT quring WW II in various Coreans plans; is conceived by Stickhead et al. (Bef 3 and 4) and private Teeribod by Stickhead et al. (Bef 3 and 4) and private Teeribod by Stickhead et al. (Bef 3 and 4) and processes used in Germany was an efficient (Issue the potent of the processes introduced desump WW II into this crossay as Keystone Cothanace Vorke, Mendwille, Promas, by Dt. IA.Gongstoff, and finally adopted by all U.S. Ordanace X Vorke, Mendwille, Promas, by Dt. IA.Gongstoff, and finally adopted by all U.S. Ordanace Johnson Community of the Stickhead of the

In one of the Intgest German plants, the Krümmit Fabrik of D A G, the following batch method was used during WP II:

Al Issuantreation consisted of the following steps:

a) Pre-nitration. The economized acid (consisting of 28%, 1800, 55% H<sub>2</sub>SO<sub>3</sub> and 158M, Glues added to the charge of solume in the Ritentor 2.5 parts of neid to 1 part of tolume. The emperature was maintained at 35400 by cooling coils, and a packet.

b) Post-attretion. The mixture was transferred to a post situator where it remained for several hours at 35-40°. Total time required for a full charge of MNT(5 mas) was 5-6 hours.

c) Separation. The mixture was transferred to a cast from varied where it was allowed to stead for 6 hours. The wasses such (N Q 0.5%, N SQ 0.0% and a small subset of airsts acid) was separated and weat as the acid successy plant while the oil underweat posification.

2) Posification: The crude oil was washed with waster.

val / post tention: The crude oil van wached with wants and justified in the presence of NACH [18 haCH lossed on the robot of the control of the post of the post

The product separated from impactices consumed of 96% o and public and 4% of smilk! The partification procedure took about 2 boars. Tobal time for the preparation of the MMT was 3-14 hours, which was much longer than the present American practice.

B) Signification or Distriction consisted of the following

a) Pre-pirenten. A charge of MNT was mixed with bi-spent soid (previously diluted alightly with water to apparance the gausser part of dissolved. Day is order to use uponey traidual HNO<sub>g</sub> as well as he extract the last succes of DNT.

b) Mirreties. After separation from the dilute soid, the oil was fed into the distract containing the orispent soid, constituting of 6-7% HNO<sub>3</sub>, 3-4% N<sub>2</sub>O<sub>3</sub> and 80% H<sub>2</sub>O<sub>3</sub>, and cooled to 30° During the addition of

the MNT the resperseure cose to 60-65° and then fell to 55° due to the excess of musicated MNT.

c) Pear-aircetten in order to complete the dinitration, 60-70% sitric heid was added to the above mixing and the temperature was subword to rise so 70-72.

Note: Time required for total distingion was not given in order to macretain it the aircration was completed, as a sample of di-oil was maken and dissilled with telescale if any of MPV distilled off, the nitrations was Condition Completed.

d) Supervisor. After allowing the charge to stand ifer 1 hours; the oil was reparated and transferred to an intermediate storage to reason. So the contract of the discussion of the contract of the c

diluted with water in order to separate the greater pass, of the DNT and to obtain an exid containing about 4.3% N<sub>2</sub>O<sub>2</sub>, 0.3% N<sub>1</sub>NO<sub>3</sub> and 73% N<sub>3</sub>O<sub>3</sub>. This diluted acid was mixed with MNT, as was instained sader (a). After this, it was transferred to a storage task where it was allowed to 'emain for 4-5 days before being seat to the nexid accessory-plant, Some

before being sent to the acid necovery plant. Some additional oil separated out during the storage. Note: Distribution in the accovery house of the di-meste, as well as of the mono-weare acids mentioned personally, gave weak mixic acid (50-55% 1000g) and weak sulture (50-70% 19.00g).

C) Telestration in the older Krimmel plant, the acid was added to the oil while in the newer plant the coverse procedure was used which is the current American practice. The new arched was constituted as follows:

a) Minestees. The trinigrator was charged with comined acid (MNO 248, M 20, 783) at a remp of 74-78 and the divoil was added gradually, with agination; while the samp was allowed to rise to 84-55. The reaction was completed by raising the grap to 96 and manifestains it there for about 4 hours.

Total time of circuition was about 6 hours.

) Separation, The agination was anopped and the unitariar allowed to sectle for 15 hours. The trivial concessions readula size(1-2, 8 HNO) and 1-2 HN 150.) was transferred to a washing house and the primport scal was slightly dijuted, with wiszer (in order to precipients out some additional TNT) and this diluted acid was used for the historical Gee above.

Note: Each sitrating house was provided with an individual funant secowary plane. The gasen formed in the circular weet, removed through resultances and forced into absorption towers where they were aprayed with water, thus forming weak nitric acid (50-5%; concentration). This acid was resorted for use in the socionistration.

1) Purification of: TMT contracted of the following.

D) Purification of THT consisted of the following operations:

The strictli (called Schril) was given asyeral water maples as 90° and, has assurable as 80° with birrections as 90° and has assurable as 80° with birrections. The smalled product had a serting point of 180° and the smalled product had a serting point of 180° and the smalled point of 180° and the smalled with as fequal services that the smalled point of 180° and the smalled color of 140° and the smalled color of 140° and the smalled color of 140° and the smalled color of 180° and 180°

washed with water.

Noter The Sellies treatment (removed the incomers of TNT (mostly betw-sad gamme-present on the amount of 4-6.5% extraintreaselesses (TeNhel) present to the amount of 0.2-0.3% and at some time imputitive. Total loss from this orienteed on the second of the second

The purified INT was heated to 83-90°, separated (while in the molten state) from water and then dired in special water-heated versels by bubbling dry hes air (at 85-90°) through the molten mass. The molten full culture sither

directly to a shall-loading pigat or to a flaker. The product with a s p, of 80.5 or higher was called Grade A, that with a isolar—B was easied 6-B There was also a Grade UK (umbristalligient) with a p 80.5-80.4 which was prept by necrystalling Grace A TNT from a water emulsion, orazing the crystalla with a small amount of sealile, rissing with water and drying.

The yield at the Krummel Fabrik was 135-142 parts of

pute TMT per 100 p of MENT, or 200 p TNT from 100 p of toluene.

Capacity of the Krimmel Fabrik was 3,000 metric coas

Capacity of the Krilmond Fabrik was 3,000 metric consper month.

Brooks (Ref 6) and Wenden & Little (Ref 10) describe the following method of manual of TNT at the Allendott, Fabrik of Dynamit A -G:

Semi-Continuous Method consisted of the following:

A) Mononitration (continuous process) was conducted in two stages. Tolures and nitric sold were fed into two pre-nitrature where the mixture was vigorously agitated for % hour at 35°. About 93% of the nitration was accomplished in these vessels. Toluene was fed in at a case of 1,000 ib per hour. The proulting emulaton overflowed into one main nitrator and then to a continuous gravity separator, which was a rectaggular steel box packed with Raschig rings, The mono-waste acid was drawn off through a trapped bottom outlet while the mono-oil went to a washer. Here the oil was washed with water and soda-ash solution and then passed through a series of stripping towers. Live steam was blown through the towers to remove the impurities, such as unnitrated tolores. benzene and parailins. The refined mosb-old was then, sent to the bi-nitrator or shipped to other TNT B) Bi- and Trinitration (batch processes) were too

b) are seen immerses (mace processes see see the USA. As much larger nitrators date used in the USA. As much as '10,000 ib of moronitrosoluses was recated in one barch (about 5 there as much as in the USA.

The bi-nitration took about 3 hours while the tri-nitration required 6 hours. For this reason there were twice as many tri-nitrators as bi-nitrators.

In the trimitrators, the mixed acid (consisting of mixed acid 24, sulfaric acid 76 and water 03) was added to the crude DNT (hold) while maintaining the temperature as 83°. Then the temperature was taked over reported of 20 minutes so 98° and maintained a thins point for 2 hours.

Note: There were no bottom outlets in the nitrapora, permitting the drywning of the charge, but is case at fire there was a quick-opening walve which permitted a large acreum-00 50% auffuric acid to apray into the nitrative to extinguish the fire (Ref 6, no 9-10).

C) Portification of TWT for Alianded). Trivall was washed with bot water, and then crystallized from fresh bot water, and then crystallized from fresh bot water. After drawing off the water and real-surying the product, it was treated with a 10% solar of Na sulfits was from 3 to 4 ho 10 as sulfits per such 100 lb of TRT. When the 14% solar was mixed with the TRT surry, there was, sufficient water peacest to bring the strength of sola to about 3% of Na sulfits. The sed waser was filtered off leaving a TRT with secting point 79,3 to 80° For a purer product (a peace 10 to 10 to

by measures with hot water and then treated while? in the molten state with a fresh dilum solution of sellice, uning a secular 1 ib Ma, SO, per 100 ib TNT.

The resulting red water was deceased and the molton THT, mached rates with hot water. Then the hot wash water was passed through 6 caoling mim so secures the INT which was dissolved in the hos

solution and descipinated on cooling (Refs 6 & 10).

Here: The Allerdorf plant command 102 is of nitric sense. por 100 lb of TNT (no against 98 to 100 lb in the U S A ). and 195-200 lb of clean (against 215 lb m the USA). The yield of \$0.4 -50.5 ThT was 200 lb per 100 lb of saluene (egninar 205-206 in the USA). Com of 1 ib of TNT was 0.553 much (obout 13 d) (Rud 6, so 11-15). which was comparable to the price in the U.S.A.

D) THT Weste Veter Treetment, in secler to olim the expense of eveneration of pasts TNT wester, a special method was developed in Garmany (on the inhessemy acute) for trenting such waters in the cald. This method permitted the money of some nitrobadios (Ref & pp 27-28), la rhie pracque the pit of weste water was adjusted to 5 by addiso some solfacie soid. This was in order to face the organic acids so that thry rould be assected by a solvens nalled Phasenal-way (presumably in mixture of buryl and looked sentated made by I G Forten managers. After appearing the naivent (commissing the expressed mercial) from mean by contributing, the polyour was distilled off. The nitrobedy obstaced an the postdue to the still was insended for use in commercial explanives. The repursed want want was meaning with him to helps the all to 7 and then many distilled he order to recover the discovery Phononculoss, This left a pollers colored waste want from which 932 of the ajmobation had been removed. It consider some inorganic impurities which were assumed to disched (Red & p 27).

Continuous Vapor Hitration of MHT to THT true devalue. ed by Dr A. Wille, and a piles pleas you built at Alleads (Red 6, p 25). The plant openings or the may of 10 the of TMT to how or I metric tons a neath, it constant at four major majors to) an associant chamber for MST, b) a server for pleastion, c) a perfect condenses and d) a hoperature

The summer chamber had use agray hearle for the 1807 feed (which was Justician to 100) and a Jud a carrie to introduce almogan gas (which was probusted to 160°) The moulting mist (vapor) of MIT in miscoom was comducted from the structure chamber to the hosten of the witnessing tower, 200 mm insude dister and 2.5 m high, note of sminless used and provided with a sminles. sevel spiral coil for cooling. The mixed soid, conce 30-33% nimic acid, was also inmoduced into the bottom of the arear and it flowed appeared with the MIT and niveyen. The temperature of the mineral in the newer was animalised at 92° and the current of nitrogen and servided sufficient nationing.

The acid and nitrobady mirrors overflowed at the top of the sever into a regionspiler stainless sored has separator, where the TNT settled to the bottom. The weeze acid contained 15% total nitric scirl and less ninese than with the latch process. The ninesem pass together with nicrogen suiden, and organic repers (so as remainstanchase) was led from the source to a ruffus conductor which returned the condensate to the bospen

of the tower (Ref 4 29). Monufacture of THT at Schial Serch Present (Ref 6, p 19). The INT plant at Schlebusch was built in 1906 - the first plant for manufacture of THE on se industrial scale.

The INT plane and during NW R was constructed in 1935 and constituted of one line with rout housest hir, trin, reliaing and drying. No monphiracion was done because the MNT was received from 1 G Estimiodization. in mak care. In the bi-busine parches of MNT up to 3500 bg wary airmand to DNT and the cycle was 5 hours, in the wate attended to JOLI state the cycle was 3 nowms, as use tribonate such batch of DNF was 4500 to 4600 hg (abbeit 10,000 hb). The unsticest production of one line was 2500 metric tomer/mostly subject 5.5 million lib.

Cantinuous Hitenticaph.dBT to TRIT or the Salebands Publish, D. A. - 10,8700 hB 27 producing in kindly de-

ecribed in Ref 10. The plant was Command River on sting of hostilities and chipped to England where if dever been assembled.

Now: A similar plant in new in exercise in Helland Class Dutch Section).

Continuous Manties of IMT on THY on the Labor. bunch Pubeth, DA-Gillarhed at Danmailly, Dr Dagetelf and callaborators developed and built during WW II a consider uses pilot plant parenting 500 metric toos per month of THE. The equipment consisted of size mannin placed in a row and connected in seriest. In the first venual, called the diluser, the bi-warm need, (amining from the 5th meson) was diluted with water. The diluted acid was transferred to the 2nd toront, nailed the extractor, in which the nitrobodies disselved in acry were extracted with MMT (delivered from one of the IG Farbentadustric plants). From those the MMT with unmound alterelation was transferred to the 3rd vessel, the ornerson. From the reputers the nil overflowed so the 4th reseal, the bi-nitrane, commining some triupant acid which was pumped from the ini-nitrane (the 6th reseal). This seld was funified with pune 60% ninic acid. The mixture of biroil (DHT) and of hi-wants acid was manufacted to the 5th percel, the separator, and from them the sold was to the diluser (let vessel) while the bi-oil west to the trinitenest (6th rensel) which contained the mixed acid pumped from the 9th resnel (serving as a separate for, the tele wested, called the pounitrantel. The arest amp was aspecation of the trivall (crude THT) from the trivenest acid and this was done in the 7th second. Then the acid was punced so the 4th tested (the bi-simular) while the trivail went to the permitteen (Sch venewil) which collesied fresh strong mixed acid. Then the mixties was pumped in the 9th vessel, the represent, and from these the sertially used mixed acid west to the mi-niconer (6th versel) while the TNT west to the wash-house. The nitames were cylindrical veneria, 2 ft inside diam and 3 fe deep previded with colla and agitators. The represents were of the cyclose type, the upper cylindrical part was 3 ft id and 2 ft high, and the beaton coulcul part I is deep. The aircasons had a capacity of 200 km bi-oil and the required amount of said. The said consume tion for his and tri-nitracipus was about the same as for the batch process, namely \$7 lbs nimic and 195 lbs steam for 100 the TNT produced (Ref 6, p 31).

Continues Method of Refining of TNT, developed on a pilor scale by Dr Demonif of Dynamic A -G and mind at Schlebnock, used size vessely consected in paries. The lax, 3rd, 5th and 7th weineln were 'sradown, the 2nd. 4th. 6th and 5th respels were separators and the

9th vessel was a dryer. The crude moites TNT (called Robert) was transferred from the nineting plant to the lot vennel, where it was agreeted with hot water. The liquid mixture was transferred to the lad vessel (cyclorie tree separator, nameles to the once used in the naturation plant), where the oil was esparanted from wante acidic water. Theor the oil was treasured to the 3rd vessel whose as upo washed, while soils in the molesn state, with a hot diluter solution of sodium sulfing (Sellim) at a pld 5 to 6. After this the trival was repersued from wanter water (4th wastel) and then washed with fresh hor warm (5th verseel). This waste water, was separated in the 6th vessel and then in the 7th vessel the TNT was washed again with water for the less time. After

depreciate the late wath water to the compressed of the compressed of the through the latest through through the latest through through the latest through through the latest through the latest through the latest through through the latest th was flaked in the usual maries (Ref 6, p 32).

Continuous Marked of Washing of THT designed by 1.Meianner (Ger P 732,742, 1940-1943). The apparatual consisted of nin vertical tail cylinders (columns) prowided with performed places. Each column was encioned in a steam jacketted feetle so that the TNT could be keps molton throughout the weahing process. After separating the emde liquid TNT from the bulk of speas seid, was emploified by means of live sman and pur-beared eir. The THT emulsion entered continuously risto the beeron of the let column and simulmneously some hor wager, required for rineing our the residual acid, was sected. The business moved upwards and, other passing through the performed places (installed in order to achieve anidany bda THT, add neserted warrain samital most medium), reached the upper part of the column where the neparator was located.

After reparating the acidic water, the liquid TAT went an the bettom of the Ind column. The process was repeated on in the lot column except that a 5% Na bienthouse solution was used in the washing medium.

In the jed column, the TNT emulsion was weather with hor water, and in the 4th and 5th column it was or washed with a 3% Na suifite solution in order to country The time and greens isomers of TNT. In the 6th column, the THT was weeked with hot water, ab in the 'lat and ini columns.

it was claimed that the process possessed the following advantages over the burch processes

a) Less time consumption due to the fact that much more intimute couract was abpained between the emulaified droptics of TNT and the trashing media then two possible with the older method

b) Better yields - 99-96% ve 90-93% with the ulder batch methods. This was claimed to be due to the fact that as acoust contact between the TMT droplers and weeking media in very abort (lean than 5 minutes in each column) their was practically as decomposition or removal of the alpha TNT and only the imparities were affected

c) Better quality of products sesting point \$0.5-80.70 vs 80.3-80.5 °C by the older unthed

d) Genter sconomy . man power requirements were

THT Refining by Mittie Acid. During WW IL the | Meinener Co developed a reflaing process with the sam of receivering the ThiT impurities for met in commercial explosives. in this process, the crude TNT was crystallized from hat nitric sold of searly 100% concentration. The manutneruitne took place in Belgium but was discontinued because of a sectious explosion. This was due to the fact that solutions of TNT in strong natic acid are very sensitive liquids known as Sprengel Type Explosives. After this accident Dr A. Wille of Allendorf modified the process to make it non-taxardous.

a) in the sew process the crude TNT was dissolved in hor, weak (about 60%) natric acid and the solution cooled to coom temperature. The crystals of purified TNT were separated by filtration from the told mother liquor which contained most of the impurities and isquor which contained most or the imputities and some sight-TNT. The INT crystalls were washed directly on the fixer was fresh 60%; cold shout he could be as a saw of the cold season with the cold was as award to be used that a saw of the cold should be a saw of the cold should be as a saw of the cold should

b) The washed crystals of purified TNT were melted and the molten compound washed with hot water. The resulting acrdic water was removed and saved mor he used later for absorption tower fred in the acid. recovery plant. The moiten TNI was further washed 2.3 times with fresh portions of hot water (saving the waste water each time), dried with hot air and then finked in the usual manner c) The first 60% nitric said filtrate (see operation a)

was distilled in a stone-lined plastic still using induction beating to eliminate basards. The average strength of the recovered acid was about 30%.

The purified TNT was of light color and had a s p (setting point) 80.2 to 80.3, it was claimed to be less studeful than TNT s of a p ab high, as 50.6 obtained by the Na sullita purification. This could be due to the fact that nitric seid removes among other impurities the DNT, while Na suifare does not. For some unknown season, the TNT refined by nitric acid could not be pellered. The loss of crude TNT on refining was around 8% (about the same as in suffice refining) but the nimb bodies recovered from the nitrie seid could be used in commercial explosives, while in the Na sulfite process the nitrotodies were decomposed (Ref 6, p 27). Leading of Assessition with TNT:

All bombs and shells were cast-loaded and the method in describere in Ref 2; pp 14-15, 18-24. Items such to deconators and some boosters were press-loaded and the procedure is described in detail in Ref 5, pp 46-48. "Bass of THT in Germany During WW III

A) Straight cont THT was used lot a) HE shells, such as the 37 mm, 47 mm, 50 mm (treach moreas), 75 mm, 75mm (smoke) and 105mm (howitzer) b) AP shells, such as 75 mm, 75 mm (capped), 47 mm (round nose) c) Land mines such as the Tellersine

B) Straight pressed THT was used in some deronators and boosters. For instance, the booster for the 47 am HE shell contained 3 pressed pellets of TMT, density 1.49, consedewich was (Ref 5)

C) THT deconsitiond with wan, A small quantity was tued by the Germans as early as WW I in their AP shells, At the Barrie of Judand, many British ships were much by German AP shells filled with desensitized TNT, which exploded after penetrating through armor, while most of the German ships were undemaged, because British AP shells were filled with P A which exploded on the surface of the armor before penetration. This was due to

the fact that P A is too sensitive to impact. . During WW II, the Germans used some AP and SAP abella filled with blocks consisting of mixture of THT

with 3 to 20% of Montan way. The Mighan was constant was in the asse where the shack of impact is once integer. The mil because consisted of semight compressed THT.

Following are the senses of TAT-was mintmen used

Fredering Ave your sames or INI-war maximes asset for leading shelder Eithers No 10, No 11, No 12, No 27, No 29, No 30 and No 100 (See under Fillers). Noszi All the allors mentioned mixturess, with the possible exception of Fillers No 29, were less powerful and brinant then straight ThiT, and their velocities of descention ware lower (Ref 4).

D) Mintres of TRT with vertice emploature. Is some mixturers, such an with RDX or PSTN, the TNT was incremented so units the composition examines and less expension to make one composition chamble and less nearlists to mechanical action than if RDX or PRIM was used alone, aloneigh the addition of TRY resulted in the lessening of power, brisages and velocity of decom-tion of the RDX or PRIM.

in another group of explosives, the TNT mes the principal high explosive component, the other importances being soided to exercis the available supply of TNT. heing soled to accept the available paper of this .

T-Smill (T-Sculf or T-Substance) . is the German designation for concentrated hydrogen beroxide (Wasserstoff) percevel). T-Smif was a clear, viacous liquid contr 80-83% M O and 20-15% m O. It was fairly stable at ordinary temperature and pressure when in the presence of small quancities of apphilizers auch as phosphoric acid. However, destine the erestreet care, it was not consible to prevent a slow decomposition of the H O late oxygen and water over a long period of time.

T-Smif was heat stored in aluminum receptacion which had been previously treated with an acid and trisodium phosphane, it can also be kept in glass vessels, but he any case extreme care must be taken to exclude any dust (inorganic or organic) or any other imputities. Other T-Stoff resistant materials reported were: copper-free al-Joseph evisions resistant macrimate reported ware: copper-tire al-minimum alloys, chromitum studies (with not least than 11% as a softeness) and polyechylene plastic. The Buna 5 and polymynlyholstede without a softenet, were less teamed whether the polymonial was not constant at all (CIOS Rept 30-115, pp 12-13).

In order to determine the assented of T-Stoff, without The operation of the control of the

According to ClOS Repr 30-113, p 8, when T-57806 as Z-5coff (see above) se MP-14 (q v), superfranced steam was formed (together with exygen) because about 552 kml/kg were liberated and a very high temperatum (480 C) was attained. The stream obtained with a solid catalyst (such as MP -14)

an autrable for diring the turbine, whereas the steam obtained with 2-Souff was a constrained of diring rockers or A TO (assigned take-off) surfable for diring nuthance because t concavaed anall particles of diring nuthance because t concavaed anall particles of Mn O. When T-Stoff was mixed with S-Souff (hydraums bydrate) in the presence of K cuprocyanide, the resulting liquid was found to ignite spontaneously.

. One of the most interesting applications of T-Scott was as a source of power for submarines as proposed by Dr Hellmuth Walter (See U-Boot Valter). Seven such submarines (300 to 500 tons each) were accepted, by the German Navy up to the end of WW II.

Dr Walter, who is now working in the USA, recently published a paper (Ref 7) describing hydrogen peroxide as a source of power. Beside submarines, be lists the following German devices where hydrogen peroxide was used as a source of power.

6) A 500 kg ATO (Assisted Takes Off) H.O. month fuel unit b) A 300 kg thrust, rocket propulsion unit for guided

minsilea c) A bipropellant 1000 to 1500 kg ATO

d). A catapult with hydrogen peroxide propulation

unit (decomposition only) for launching V-1 s e) Controllable propulsion of a 750 kg thrust unit (or the Messerschmitt 263

f) Rocket training airplane and a controllable power plant giving to 2000 kg thrust for the Meanerschmiet 263 B.

(See also Gap Tear in the general nection).

Übertregungskpuffizient eder Senzibilitörskooffizient (Transmission Coefficient or Sensitivity Coefficiend According to Stett backer, Schiest- and Sprungemilie. Leipzig (1933), p 43, the coefficient of managizaire of deconation by influence (Le) is calculated from the following equation:

Le = c/c, , when

(c) in the weight (such as 50 g) of an explicative to be instituted by influence and (e. ) is the weight of a standard explosive, such as picrit acid (P A ) solving as as initiame by influence.

if the distance between explosive charges in 15 cm. there is order to demonsts 50 g of P.A. (c = 50), it would require 30 g of P.A. (c, = 50). This would give for the (La) the value of 50/50 = 1.

in assist to decounte 50 g of TNT (t = 50) is would im successary to use 68g of RA (c, = 68) while for 50 g of terryl only 28 g of P. A would be required. This gives for (i.e) the value of 30/68 = 0.78 for TNT and the value

of 50/28 = 1.00 for purpl.

Note: The higher the value of (Le), the more sensitive in an explosive me intrincion by influence.

U-Beet, One-Men; Oce-Men Subscrine or One Men Torpade (Ein-Man Torpade), This device connisted of a sanil one and subscrine to the bottom of which a torpade was attached by means of shartles. The combination was propelled by an electric most in the submarine operated by storage batteries. The paint brought the device to wishin a fairly bacteries. The plans brought the certice to widths a lastly about dismance of the target (such as as enemy ship, dock, warehease, wit; ) before priesting the 'copyedo. The toppede calc sized by lining so the submaries with the target. After the property of the plant of of

U-Boot, Poeket (Pocket Submerine). See Sochund

U-Boot-21 oder Unternenhaar 21 (U-Boot 21) (Sono-merin 21, to French) was a submarine developed in the last pare of WW II but not produced in large quantity. It was 77 m long, 61/2 m wide, displaced 1600 tonu and wan peovided with 3000 HP Degreis and 3000 HP electric motors. Its speed to submerged condition was 18 knots nanimot .7 knots of the older submating models "7" and "9". The U-boot-21 could ravel as such as 30,000 niles without refeelling or restocking.

U-Bost Walter (U-Beat of Walter) (Submarine With Chauical Propulsion) . (Sous-maris à propulsion chimique, in French), in order not to be dependent on amougherie oxygen for the operation of submarine Dinnel enginess when in submerged condition, H. Waiter and collaborators designed a draice in which concentrated hydrogen may oxide (T-Stail) was casslymeally decomposed in the percence of Ca paraunganess into mater and onyging The oxygen was used for operating the Diese. same time, the energy liberated on decomposit h of the hydrogen peroxide, which amounted to 590 kg//kg/(cnl) culated for 100% peroxide), was stalled to of fact a gr rubine directly consecred to the propeller shalls a by-product of this reaction pure water was obtain which was used for drinking and croking purpose

According to Ref 5, the above system was called "Closed Cycle Disuel Development for Submerged Propulsion", and the idea for such as engine goes back to the time of WW I when the Germania Werit at Kiel tried to use computered crypts for Dunels. No work on the subject was done until 1939-1940 when the German Navy requested some fitme (such as Zeppelin Gmbhi, Kommandir Genellachtat Bains) and research institutions (such as the Fonctiongauestour diff 'Emittheneuge, under the discretion of Prof Lanne sed by thebri to resource the project, and the second of the secon requested some firms (such an Zeppeiis Gmbit, Kommandi and two outboard tylinders with compressed origins. The Kamm's equipment was somewhat bulkist than that of Valor: in addition to the type KVIK submarine, it was planned to build a submarine with a smaller regime and so use liquid oxygen carried in two insulated tanks. The work on the closed cycle regime project did not progress very fass as it was considered by the High Command to be of Very last he it was considered by the ripp community of the secondary (higherency: 10 to 10 (See also Scenario and tuder T-Saoff).

Unterwesserengeneffe (Underweier Explosives). Extensive study of underwater explosives. Explosives of underwater explosions (Unterwaterspressum grap) and of German underwater explosives was considered by De A-Sternard and Constant and speen game pen) end of German underwater explosiven was conducted by Dr A. Shetthacher, Zürich, Switzerlamit He described some of his investigations in books and papers published an Germany and Switzerland (See Refs 1-5). Some additional information on German and Switzerland Common was communicated to the author by Dr. S. replaces the second of the sec values of underwater effectiveness given in this report are not included in this work.

age not included in this work.

According to Sectioncher the principal explosives
used during this for loading the see mines (Seminen),
depth charges (Tiefmonben) and corpedoes (Tongedos),
commissed of TNT and HNDPhA (herastrodiphorylamue). One such explosive composition consisted of TNT/HNDPhA - 60/40, while another contained TNT/HNDPhA-35/65. The latter mixture was called Schiosswelle resure

Note: It is of interest to report that previous to \$17 and se early as 1978, the Germans, in their underwater amminion, used mixtures of TNT, HNDPhA, TeNA (term sizossiline, called Term in German) and TNB (traitrobenzene). Straight TNT was also found to be suttable as an anderwater explosive. Towards the end of bal large proportions of aluminum powder were introduced in under-water emplosives. One such mixture, known as Scheins solle 18 (abbreviated to Schw 18 and later called \$-!) was used

sucressively during WWII. Its composition was TNT/ Note: Stettbacher's reported analysis of this mixture was

61.8/23/15.2. He suited that to was very effective is all kinds of underwater charges. At about the same time as above (1918), a mixture to which PETN was used in lieu of INDPhA was introduced it was called Schw 19 and contained PETN/TNT/Al

It was called Schw 17 and Continues Factor 1936), the Stated to rearm (about 1936), the minimum called 5thw 36 or 5-2 (TNT/HNDPhA/A) - 67/8/25). made its appearance. V-2 oder Vergeltungswelfe Zwei (V-2 or Revenge Wenpo Two). The official German designation was 4-4 . V-2 was a cocker provided with 4 stabilising line. It could (Iv with a speed up ur 1600 mph to a distance up to 220 miles and at altitudes up to 50-60 miles. The body of the rocket was cylindrical in shape with a some tapering to a sharp point. The largest dispeter was about 5' and the overall length was 46', Fully loaded it weighed about 14 tons, which included 9 man of feel supply and about 1, ton of special explosive that could withnessed high rempetatures in the wethend. The first of these rockers was fired against Easland in Sept. 1944. A total of 1115 V-2 rockets were fired up to April 2, 1945, and they caused considerable damage especially in London and vicinity

(Same as given under V-B

V-1 and V-2 (Explanious Used in Verboade of). At first both the V-1 and the V-2 used mixtures of TNT and Am airrate. These were replaced by Amatol 39 (DNB 30; Am nurses 35 and RDX 15%) or by Amarol 40 (Dinitroanisale 50, Am sitre'te 35 and RDX 15%). While Amarol 40 was suitable for caut-loading, the Amerol 39 gave occasional cavities when case-louded alone.

la order en eliminate the cavities in cuse-loading, Romer proposed later to pour the Amerol 39 over pieces of Biscuit Minters A which consisted of Am nigrate 50, rechoical Ca nivete 25, PETN 10 and RDX 15%.

Still inter in the way, when the shortage of arountic compounds became more arete than ever, it was proposed to any mixtures not containing the nigrouroustics, as for instance; technical Co names 55, powdered peat 5, Al porder 10 and 30% of 90/10 methyl minute/bessess min-

V-1 and V-2 (Propollours Used in). As wis mentioned under Rocker Propellents (Liquid), the Germans used compersued air as the unidizer and question as the fact, in the Y-1. For the Y-2 recket they used liquid oxygen so the exidizer and ethanol containing some water at the

Nose: According to J.G. Tectimiert, Chen Engle Nows 32, 2584-(1954), water was added to slooked in order to keen the flowe temperature sa low as possible to avoid direnge to the combestion classiber of the cocket mores. For the name reason fuels of higher heating values, such as gazoline, were not used in these rockets. It was found that a mixture of situated and 25% water had a flame temperature 7% lower than pure alcohol while its exhaust velocity was only 3-5% lower. This means that on adding 25% of water to alcohol, is was possible to use a semewhat lower structural structch for the motor without sacrificing too much is performance. The same number on p 2585 states that in 1944 perpurations were made to replace liquid oxygen in the V-2 with absolute nimic acid.

Wallarada (Pulvar), A type of sporting propellant manufactured for many years by the Wolff Co at Waterode in Germany and by the Chilworth Gunpowder Co, Ltd in England. The original propellant was prepd by gelatinizing pure NC with ethyl scarate and adding water (35% of rotal volume) to the resulting jelly. Then the mixture was kneeded and , while continuing this, operation, live strem was introduced. This resulted in the formation of very small grains of gelatinized NC. For removal of volatile nelvent, the grams were treated under pressure with boiling water and then dried (Ref 1). The composition of such a propellant, given in Reis & and 4 was as follows: NC 98.6 and volatile matter 1.4%; its calorific value was 1014 keal/kg and volume of gas at NTP 875 1/kg of which 14.8% was nivogen. .

A different composition for Valerode was given in Ref 3: suncotton 77. Ba nitrate 10, grease 7.0, agarager 3.0, glue 7.0 and maisture 1.0%

Warminghoversuch (Warm Storage Test), called also Logerbearundisheit oder Heltberkeit (Subility in Scorage or Stability) is a test similar to the American Surveillance Teas, it was conducted by storing a 10 g sample of a propellant (or an explosive) at a temp of 75 or higher in a closed giage vessel until the appearance of nitrogen oxide fumes. The longer the time tequired for the appearance of fumes (which might be from several days to several weeks) the most amble was considered the substance under test.

Robpulvermange) (q v ) deserves so be described here briefly. The denitration was carried out on the spent acid coming from the separator in the nitrating house and from the wash water which resulted from washing the oil in the

Procedure:
Spent seeid (NNO 9, H. 50, 65, wasse. 21 & DEGDM oil
55, density 1.60) was well through a separator to remove
the settled explosive oil and then the acid was freed
ac-called destructor galaxas, henced to show 1.00 as
ac-called destructor galaxas, henced to show 1.00 as
conclient midistics of explosive oils, the waste acid was
assulfy mixed with some 50% of airtic acid before sending Nones

a) hasmuch as spent DEGDN soid decomposed maidly on someting (especially in the presence of mosaure), it was not stored for loager than a few hours, but preferably was worked up as soon as the nitration of the DEG

b) It was required that destruction of the embasive oil should be complete and that the resulting acid by light in color, if it was black, the destruction of oil was not complete and the heating had to be continued after adding some more 50% surric sold

c) For destruction of oils dissolved in with untern, was sufficient to run them through the destruction co

d) The attroug games formed in the destructor went to a condenser from which they were drawn into an absorption tower. An acid of about 40-50% atreagth, was recovered. tower. An acid of shout 40-90% strength, was recovered. The night acid collected in the condenser was bleached by bubbling at through at. This yielded white nitre acid of 38-40% attempth,

of The salfume acid which flowed from the lower end of

the destructor was conducted to a cooler from which it was too to swage tasks it contained about 71% H 50°, and the density was 1.64. No oxides of nurogen were perthe density was 1.04. No oxides of nimogen were per-masted to be present and tenta were made continuously for them with ferrous sulfage.

1) The recovered mirric acid was reheated and passed through an Austhiasor (blow-out column) where the re-

through an Austrager (alow-out column) where the re-maining situages unides were removed by a stream of air. The acid then passed through a syphon into an intra-medianc containtr from which it was sent to a storage conk, Reference: Scietland, PB Rept 925, (1945), p 62.

The explosives of Table 64 were divided Amen ne propries of Table 64 were divided hate three groups:

A. Ammon ne partor Watter springs abothe (Ammonium Nittane Peministhe Explosives), marked in Table 64 above as Non-get (Non-Gelatinous).

B. Hittenglycenin-Wattersprings to Me. (Nitroglycenia Peministhe Explosives), marked in Table 64 above as

Permissible Explosives), marked in 1808 de above 28 Semegel (Semigelationes)
C. Gelatinose-Wottersprongulatio (Gelatinous Permissible Explosives), marked in Table 64 above as

Gel (Gelatinous).

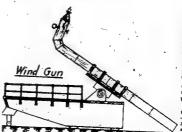

The (A) group included powdery compositions with a NG content not higher than 5% and a density of about 1.0. Wetter Ammoncahusit, W-Astralit, W-Detonit, W-Ligansit, W-Monachit and W-Ventfalit beloaged to this

Lignosit, W-Monachitt and W-Wastellit belonged to this grown. They were sustained for hisaming soft could be sufficient to the (B) group included partly selfations but not plastic expensions occursions in 1.15% of NoR-CC cell and had well as the contract of the country of the

Wayed Emicos'ven, patented in 1895, were based on a minimum of MG and coal tax (crosover), as for instance; and 77, crosses 4.5, called cotton 1.0, Na minute 33.0, ref flower 9.0 and 1.5 and

Wgr 21 am. An air-to-air, solid propellent rocker developed in 1943. Lausching weight 176 lb, overall length 3.7 ft, diameter 6.3° and velocity (all burnt), 1,050 ft/sec.

Witholm Explosives, parented in 1894, were manufactured by Dynamic A - G. E g: a) Am situate 90 and abiline tattrate (neutral) 10%, b) be existe 94 and apphylemine constant 6%. Reference: Daniel, Detriconative, Paris (1902), p 309.

Note: According to Marshall, v 3, p 123, all German coat mining explosives contained a large excess of oxygen. This achieved two purposes: a) it lowered the brisance of an explosive so that the

coal would not be broken into very small pieces.

b) it avoided the formation of carbon monoxide which is undesirable because of its high toxicity, is undestrable because of its high toxicity.

Too large an excess of oxygen also had to be avoided because it caused the formation of attrogen oxides which are pateonous (sithough not as much as carbon monoxide).

Witel . The name given to synthetic toluene.

Wohl Dynamics, patented in 1891, were based on the low-freezing NG, which was prend by the nitration of glyceria previously heared with concd sulfuric acid to 130-160° and then cooled. As the result of this heating, some polyglycerines were formed which on nitration gave low efreezing nitropolyglycerins.

A-Stoff, See Tetan.

Zabel, in 1899, constructed a metallic carridge consisting of two compartments divided by a thin partition. In one of the compartments was a mixture of Ca carbide and Ba peroxide, while the other contained a dilute acid solution, On breaking the partition the acid reacted with carbide and peroxide to form a mixture of acetylene and oxygen which immediately exploded. Reference: Daniel, Dictionnaire (1902), p 814.

Zoitschnur (Time Fuse), called in the US A Safety of Blasting Fuse. See under Fuses in the general section. Zoltachnurzeitzunder (Time Igniter With Fuse), See under Electric Ignitets, of Primers and also in Beyling-Diekopf (1936) pp 175 & 266-69.

Zeff-ligelit was a perous vinyl chloride polymer inminute for use an an outside atmost for the au intake tube (Schnickel) as well as for the periscope in order to prevent the detection of submarines by short waves sent from enemy places

The pores of Zell-Igelit contained nitrogen generated within the material by a special process involving the use of a substance known as "Porofor N". For this a mixture consisting of polyvinyl chloride, 95 and Porotor N 57, was beated in an autoclave at 1 100 and then the mass was laminated. During this process the Porotor N dissolved in the vinyl chloride and reacted with the liberation of nitrogen which formed hubbles inside the material. Each Schnorker tube was covered with 7-8 layers of the above porous laminute each layer being separated from the other by interposing carbon black coated paper, which was slightly conductive to electricity. It was assumed that the incoming short waves from a radar generated convection currents within the cathon paper and these currents were sub-sequently buffered if not completely absorbed by the Imminutes. Reflection of the short wave was thus minimized if not completely absorbed by the insulating mans. Reference: CIOS Report 25-18 (1945), pp 29-30,

Zeilpach. See under Raschig's White Blasting Powder.

Zinn (Tin). See general section. Note According to A.Stetthacher, Spreng- und Schiesarolle, (1948), p 43, small quantities of tin, (or of its easily reduceable compounds) were incorporated in some German NG smokeless propellants in order to protect the inside of gun barrels from emsion .

Z-Solu the name given to Na or Ca permanganates used as oxidizing components of moreir propellants in which T Stoff, served as a combustible composent. A-Salz was used in the Feuerlille type guided missiles called Hecht, Reference: L. Ross, Jr., Guided Missiles, Rockets and Torpedoes, Lothrop etc N Y (1951), pp 45-46.

Z-Stoff C. An aqueous soln of calcium permunganate commining 600 g MnU, per liter 5p gr 1.4 at 20 and fr p. 22. Used as a catalyst, as described below (CIOS 30-115, p.10).

Z-Stoff N. An aqueous soln of sodium permanganute containing 600 g of MnO, per liter Sh gr 1.4 at 20° and fr p-80° Used us a liquid chiefyst in viewid toeset propellants to asset the decomposition of hydrogen peraxide which served as a source of oxygen (CIOS 30-115, bp 8 & 10).

Note: Z-Stoff N was used in summer since its fr p is -3°, while Z-Stoff C was used in winter (fr p -22°). When Z-Stoff C or N is used to decompose the T-Stoff (hydrogen vapor and oxygen some small particles of manganese dioxide. Due to the presence of these particles, the gaseous mixture thus produced is not suitable for driving a turbine mixture disa producted is not suitable for driving a rubine but can be used for other purposes such as in assisted take-off units and an mekets. When it is necessary to obtain a gaseous mixture free of MaQ the decomposition of H<sub>2</sub>Q<sub>2</sub> is conducted by means of a solid catalyst, such as described under MP-18.

Zünder-See Fuze.

Zündersprengkupsel-43. A separate dap and détonator assembly designed for use in some A/T mines in con-junction with a tilt type igniter, called Kippauder 43 [ TM 9-1985-2 (1953)].

Zündkraft. See Initiirvermögen.

Zundpetrononsotz. Ser Cartridge Case Percussion Piffner. Zündsetz (Priming Composition). See Primary and Initiating Compositions,

Zündschnuren zünder (Igniter or Lighter for Fuse). Beyling-Drekopf (1936), pp. 166-69, describes several types of ignitiers. Some of them are intended for use in firehead-jamiters and the several control of the control of the for gaecus manus (für Schlagwertergruben), while others for gaecus manus (für Schlagwertergruben).

2 undstoffe oder Initial explosive offe (Priming, Igniting or Initiating Compounds). See Primary and Initiating Compositions.

Zundversterker (Ignition Intensifier), Ignition of a pro-pellant in 50 to 280 nm weapons was accomplished by means of a primer combined with an igniter contg about 2 g b.acx powder. For larger guns, an extension, called Zundvermarker was liked in front of the primer. This was fulled with large grains of black powder and had a venturi as the lorward end to thow the flame the full length of the charge. There were also one or two small side holes to ignite the cent of the charge as well-Reference: CIOS 31-68 (1946), p ? (See also under Ignation).

Zunehmunder Draff. See Progressive Rifling.

Zunammengunetate Zunder (Camponite Ignitern of Primers, are described in Beyling-Drekop! (1936), p .74.

Zwischmledung, Zwischenzundladung, öder Zwischennumber (Intermediate Charge of Booster) is described in A. Stettbacher, Schiens- and Sprengstoffe, Leipzig (1933), p 352.

Zwischenzunder, See Zwischenladung. Zwischenzundladung. See Zwischenladung.

Burning resu(Fa. 494)

Brennschluss

End of burning

Note: According to W. Dornberger, V-2, Viking Press, N Y (1954), pp 9-14 the above word in used in liquid tockets to signify the moment of disappearance of the flame issuing from the tail of a rocket. The English term "all burnt" is not correct, because at Brennachluss considerable quantities of fuel may still be left in the tanks.
